## C 875264 : MAJOR MANUFACTURING PHARMACY

KEY WORD: THEOPHYLLINE / CONTROLLED RELEASE / POLY ( ETHYLACRYLATE  
METHYLMETHACRYLATE ) AQUEOUS DISPERSION / FLUIDIZED BED  
URAIWAN PETCHARUNPAISAN : CONTROLLED RELEASE THEOPHYLLINE  
GRANULES COATED WITH POLY ( ETHYLACRYLATE METHYLMETHACRYLATE )  
AQUEOUS DISPERSION BY FLUIDIZED BED TECHNIQUE. THESIS ADVISOR :  
ASSOC. PROF. GARNPIMOL C. RITTHIDEJ, Ph.D. THESIS CO-ADVISOR :  
ASSIST. PROF. WICHEIN THANINDRATARN, 178 pp. ISBN 974-637-103-7

Theophylline granules of 18/20 mesh size were coated with different level and lot of Eudragit® NE 30D [ poly(ethylacrylate methylmethacrylate) aqueous dispersion ] containing Cab-O-Sil as an antiadherent by fluidized bed technique. Different ratios of Eudragit® NE 30D to hydroxypropylmethylcellulose, a nonelectrolyte, water soluble polymer, or to Eudragit® RL 30D ( ammonio methacrylate copolymer, type A ), a cationic water insoluble but higher permeable polymer, were also employed. The physical properties and the drug release characteristics of coated granules were evaluated. The influences of processing variable, spraying method and atomizing air pressure, were also studied.

All Eudragit® NE 30D coated granules exhibited smoother surface than uncoated granules. Increasing the level of coating increased the thickness of film, thus the rate of drug release was decreased. Eudragit® NE 30D lot B produced rougher and more porous surface coating film than lot A which led to higher release rate, probably due to the polymer stability. The mode of spray apparently affected the surface characteristics and the flow rates of coated granules but both top spray and bottom spray method caused similar drug release characteristic. This result might be due to differences in the particle motion during the coating process. Higher atomizing air pressure gave less continuous characteristic of film coating probably due to the decreasing temperature in coating chamber which might not be conducive to optimum film formation. Thus, higher drug dissolution was obtained.

Addition of hydroxypropylmethylcellulose caused less porous and smoother surface whereas Eudragit® RL 30D caused more porous and sponge-like surface. Both polymers dramatically increased the drug dissolution. The release of drug from granules coated with 4.66 % Eudragit® NE 30D lot A and 13.51 % Eudragit® NE 30D lot B could conform to the monograph of extended-release theophylline capsules in USP XXIII.

## **ACKNOWLEDGEMENTS**

I would like to express my sincere gratitude to my thesis advisor, Associate Professor Garpimol C. Ritthidej, Ph.D. for her invaluable advice, guidance and encouragement throughout this study. Her patience, kindness and understanding are also deeply appreciated.

My special thanks are also extended to Assistant Professor Wichein Thanindratan, M.Sc. in Pharm, my co-advisor, for his invaluable suggestion.

Grateful acknowledgement is expressed to TRITON ( Thailand ) Ltd. for kind provision of Eudragit<sup>®</sup>NE 30D used in this study.

A special appreciation is also given to the Graduate School, Chulalongkorn University for granting partial financial support to fulfill this investigation.

The special acknowledgements are given to all members in the Department of Manufacturing Pharmacy and my friends for their kind assistance.

And most of all, I would like to express my infinite thanks and deepest gratitude to my parents for their endless love, encouragement, care and understanding.

qs.	make to volume
r <sup>2</sup>	coefficient of determination
% RH	percentage of relative humidity

rpm	revolution per minute
sec.	second (s)
SD	standard deviation
SEM	scanning electron photomicrograph
TAMCI	trimethylammonioethylmethacrylate chloride
USP	The United States Pharmacopoeia
UV	ultraviolet
w/w	weight by weight
w/v	weight by volume
µg	microgram (s)
µl	microlitre (s)
µm	micrometre (s), micron (s)
