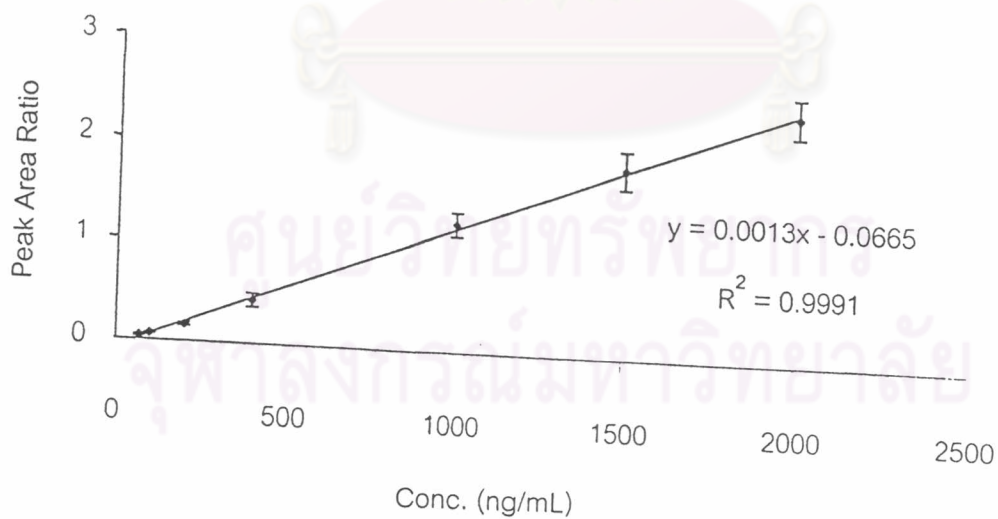

Figure 31. Typical calibration curve for determination of diltiazem hydrochloride in plasma

## APPENDIX B

## STATISTICS

Average

$$\bar{X} = \sum X/n$$

Standard deviation (S.D.)

$$\text{S.D.} = \sqrt{\sum (x - \bar{x})^2 / n - 1}$$

Coefficient of variation (C.V.)

$$\text{C.V.} = \text{S.D./Average}$$

Area under the concentration time curve ( $\text{AUC}_0^\infty$ )

$$\text{AUC}_0^\infty = \frac{\sum (C_{n-1} + C_n)(t_n - t_{n-1})}{2} + \frac{\hat{C}}{K}$$

Elimination rate constant (K)

$$K = \frac{\ln C_1 - \ln C_2}{t_2 - t_1}$$

Half-life ( $t_{1/2}$ )

$$t_{1/2} = 0.693/K$$

## Analysis of variance

The experimental design is as follow :

| Sequence | Subject No. | Period |   |   |   |
|----------|-------------|--------|---|---|---|
|          |             | 1      | 2 | 3 | 4 |
| I        | 1-3         | A      | B | C | D |
| II       | 4-6         | B      | C | D | A |
| III      | 7-9         | C      | D | A | B |
| IV       | 10-12       | D      | A | B | C |

Where A, B, C and D = formulations 1, 2, 3 and 4, respectively.

In statistical terms the calculations to set up an analysis of variance table are as follow:

| Source of Variation | df            | SS   | MS  | Variance Ratio |
|---------------------|---------------|------|-----|----------------|
| Total               | $g.n.t-1$     | SSTO | -   | -              |
| Sequences           | $g-1$         | SSG  | MSG | $MSG / MSS$    |
| Subjects(Sequence)  | $g(n-1)$      | SSS  | MSS | $MSS / MSE$    |
| Periods             | $p-1$         | SSP  | MSP | $MSP / MSE$    |
| Formulations        | $f-1$         | SSF  | MSF | $MSF / MSE$    |
| Error               | $(gn-2)(t-1)$ | SSE  | MSE | -              |

df = degree of freedom

g = number of groups or treatment sequences

n = number of subjects per group or treatment sequence

t = number of treatment

## 90% confidence interval

Ln-transformed data

$$90\% \text{ CI} = (\bar{X}_T - \bar{X}_R) \pm (t_{0.1,df} \times \text{S.E.})$$

$$\text{S.E.} = \sqrt{2\text{MSE}/n}$$

$$\% \text{ lower limit} = \left\{ e^{[(\bar{X}_T - \bar{X}_R) - (t_{0.1,df} \times \text{S.E.})]} \right\} \times 100$$

$$\% \text{ upper limit} = \left\{ e^{[(\bar{X}_T - \bar{X}_R) + (t_{0.1,df} \times \text{S.E.})]} \right\} \times 100$$

## VITA

Miss Aninda Akkarasrisawad was born on August 3, 1973 in Bangkok. She received Bachelor Degree of Science in Pharmacy from Faculty of Pharmacy, Mahidol University, Bangkok, Thailand in 1997. After graduation, she worked at Kasetsombun Hospital from 1997 to 2000 before entering the Master's degree program in Pharmacy at Chulalongkorn University.
