APPENDICES

APPENDIX A

Solubility of Hydrochlorothiazide in Various Solvents

Table 31 Solubility of Hydrochlorothiazide in Aqueous Solutions (14).

Solvent	Temperature (°C)	pH of the solution	Solubility g in 100 ml solution
water	25	7.2	60.9×10^{-3}
water	37	7.2	108×10^{-3}
0.9% NaCl	25	6.1	59.4×10^{-3}
0.1N NaCl	25	1.0	60.8×10^{-3}
0.1N acetic acid	25	2.9	63.6×10^{-3}
0.1N acetic buffer pH 4.4	25	4.5	62.3×10^{-3}
0.067 M phosphate buffer pH 7.4	25	7.4	61.6×10^{-3}
0.05 M borate buffer pH 9.0	25	8.9	103×10^{-3}
1 M ammonia		11.6	2.2
0.1 N NaOH	25	10.2	1.79
simulated gastric fluid pH 1.1	37	1.1	108×10^{-3}
simulated intestinal fluid pH 7.4	37	7.5	109×10^{-3}

**Table 32 Solubility of Hydrochlorothiazide in Non Aqueous Solvents
(14).**

Solvent	Temperature (°C)	Solubility g in 100 ml solution
acetone	25	13.7
acetic acid	25	0.15
acetonitrile	25	2.0
ethylacetate	25	0.59
chloroform	23	0.1
ethanol (96%)	23	1.3-1.4
methanol	23	3.9-4.1
dichloromethane	23	<0.02

APPENDIX B

Statistics

1. Mean (\bar{X})

$$\bar{X} = \frac{\sum X}{N}$$

2. Standard Deviation (S.D.)

$$S.D. = \sqrt{\frac{\sum(X - \bar{X})^2}{N-1}}$$

3. Analysis of Variance (ANOVA)

Source of Variation	d.f.	SS	MS	VR
Among groups (Treatment)	k-1	SS _{among}	MS _{among} = SS _{among} / (k-1)	VR = $\frac{MS_{among}}{MS_{within}}$
Within groups (Error)	N-k	SS _{within}	MS _{within} = SS _{within} / (N-k)	
Total	N-1	SS _{total}		

d.f. = degree of freedom

SS = Sum of Squares

$$SS_{among} = \sum_{j=1}^k n_j (\bar{x}_j - \bar{x}_{..})^2$$

$$SS_{within} = \sum_{j=1}^k \sum_{i=1}^k (x_{ij} - \bar{x}_j)^2$$

$$SS_{total} = \sum_{j=1}^k \sum_{i=1}^k (x_{ij} - \bar{x}_{..})^2$$

MS = Mean Square

VR = Variance Ratio

where x_{ij} = Observed Value at Treatment j

i = 1, 2, ..., n

j = 1, 2, ..., k

$$T_{\cdot j} = \sum_{i=1}^{n_j} x_{ij}$$

$$\bar{x}_{\cdot j} = \frac{T_{\cdot j}}{n_j}$$

$$T_{..} = \sum_{j=1}^k T_{\cdot j}$$

$$\bar{x}_{..} = \frac{T_{..}}{N}$$

$$N = \sum_{j=1}^k n_j$$

Comparing the VR value with the critical value F obtained from table at degree of freedom (k-1) and (N-k):

- If $VR > F_{(\text{table})}$, we reject the null hypothesis that $\mu_1 = \mu_2 = \mu_3 = \dots = \mu_k$ and accept the alternative hypothesis.
- If $VR < F_{(\text{table})}$, the null hypothesis stands.

4. Honestly Significant Difference Test (HSD Test)

$$HSD = q_{\alpha, k, N-k} \sqrt{\frac{MSE}{n}}$$

α = significant level

k = number of treatments

n = sample sizes of each treatment

MSE = mean square of error from ANOVA table

Value q obtained from table at degree of freedom k and (N-k) and HSD obtained from calculation.

If the difference between treatment means (absolute value) of each pair of treatments is more than HSD value, therefore, this test finds this pair of treatments to be significantly different.
