## APPENDICES

### Appendix A Identification of Characteristic FT-IR Spectrum of Undoped and Doped Poly(Pyrrole)

The undoped and doped Poly(pyrrole) (Ppy) were first characterized by FT-IR spectroscopy in order to identify functional groups. An FT-IR spectrometer (Thermo Nicolet, Nexus 670) was operated in the absorption mode with 32 scans and a resolution of  $\pm 4 \text{ cm}^{-1}$ , covering a wavenumber range of  $4000\text{-}400 \text{ cm}^{-1}$  using a deuterated triglycine sulfate detector. Optical grade KBr (Carlo Erba Reagent) was used as the background material. The synthesized ppy was intimately mixed with dried KBr at a ratio of Ppy:KBr = 1:20.

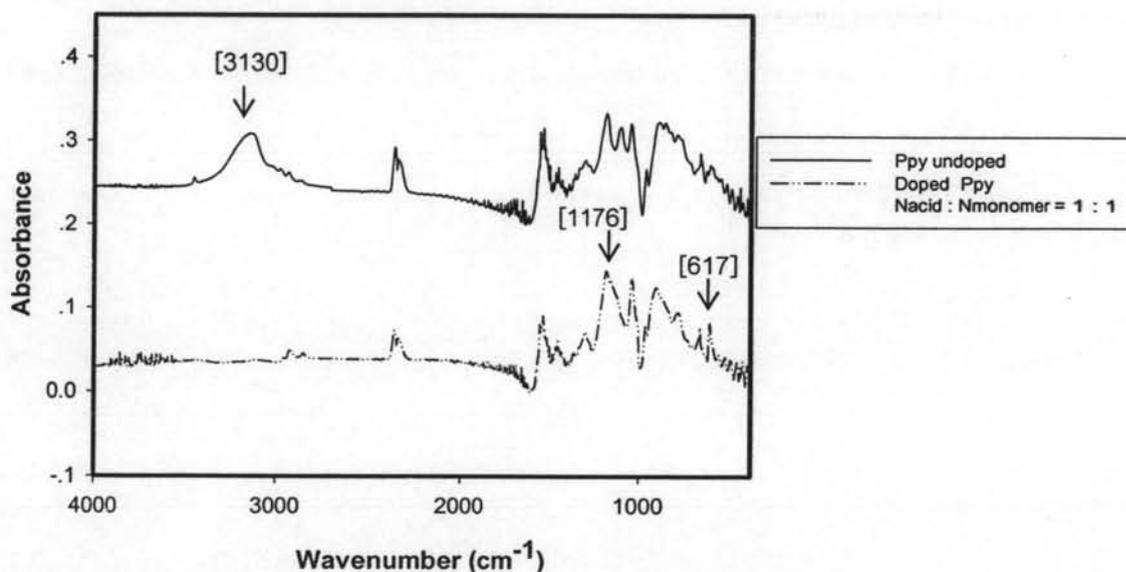

Figure A1 The FT-IR spectrum of undoped and doped Ppy.

The assignments of peaks in the spectrum are shown in Table A1. The characteristic peaks of Ppy were found between  $4000$  and  $400 \text{ cm}^{-1}$  and can be assigned to the stretching vibration of the C-H bond on the pyrrole ring; the peak at  $3400 \text{ cm}^{-1}$  represents the N-H stretching of pyrrole ring; the peaks at  $3000\text{-}2800 \text{ cm}^{-1}$  represent the aliphatic C-H bonds; the peaks at  $1560$  and  $1531 \text{ cm}^{-1}$  can be identified

as the asymmetric and the symmetric C=C /C-C stretching vibrations in pyrrole ring. After polypyrrole was doped that peak at  $1183\text{ cm}^{-1}$  represents the S=O stretching vibration of sulfonate anion; and the peak at  $620\text{ cm}^{-1}$  indicates the characteristic vibration of DBSA. Both  $1183$  and  $620\text{ cm}^{-1}$  peaks increase with increasing DBSA concentration.

## Appendix B Identification of Characteristic Peaks of Undoped and Doped Poly(Pyrrole) from UV-Visible Spectroscopy

The UV-Visible spectra of undoped and doped polypyrrole recorded with a UV-Vis absorption spectrometer (Perkin-Elmer, Lambda 10). Measurements were taken in the absorbance mode in the wavelength range of 700-300 nm. Synthesized Ppy was grinded into a fine powder, dissolved 0.05 g. in m-cresol 100 ml. and the solution was poured into the cuvette quartz cell. Scan speed was 240 mm/min with a slit width of 2.0 nm, using a deuterium lamp as the light source.

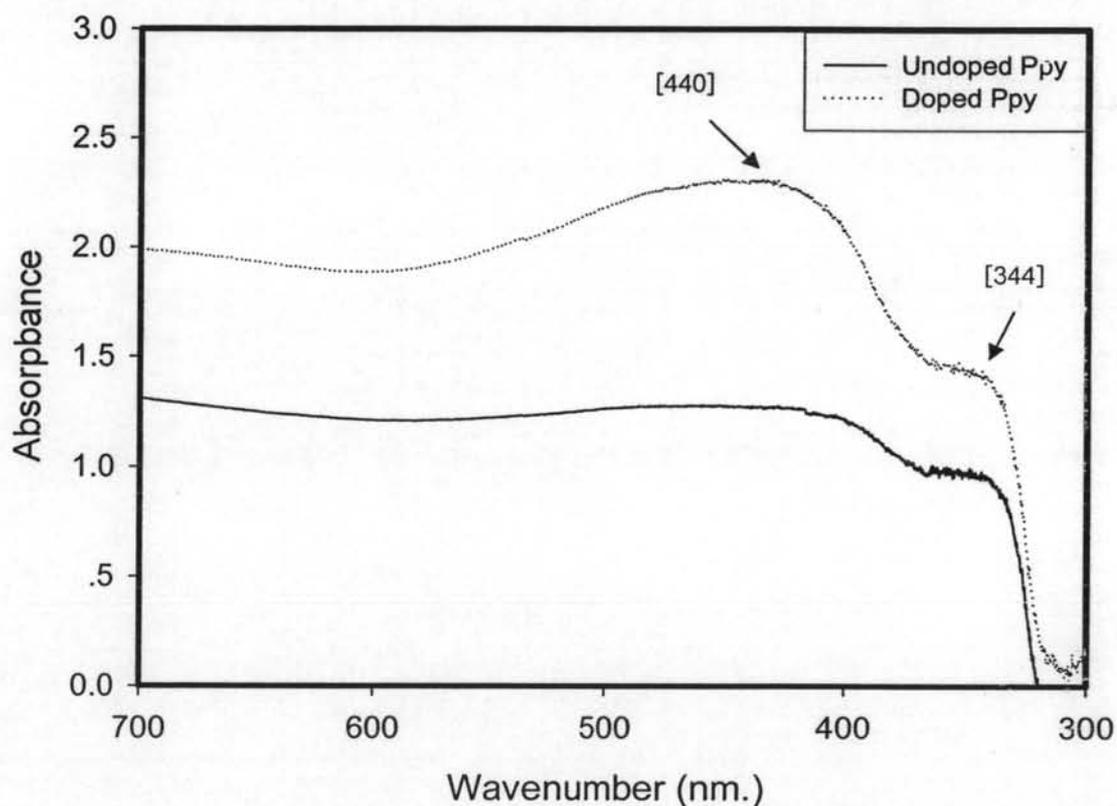

Figure B2 The UV-Visible spectra of undoped and doped Ppy.

The UV-Visible spectra of undoped and doped poly(pyrrole) from the references are shown in Table 2B. The wavelength in [] refers to the results of the assignments cites from references.

## Appendix D Density Measurement

The specific density ( $\rho_p$ ) of poly(pyrrole) was measured by using a pyncometer. We used a 25 ml pyncometer. First step, the weight of blank pyncometer was measured and we added acetone into the pyncometer and we remeasured the weight again. The specific density of acetone at testing temperature was calculated by equation (D.1).

$$\rho_a = \frac{(a-b)}{25} \quad (D.1)$$

where  $\rho_a$  is specific density of acetone ( $\text{g.cm}^{-3}$ ), a is the weight of pyncometer with water (g), and b is the weight of blank pyncometer (g).

Second step, weight of blank pyncometer was measured again, then we added Ppy powders into the pyncometer, and measured the weight changes. Then we added acetone into the pyncometer and remeasured the weight of the pyncometer. The specific density of poly(pyrrole) at testing temperature was calculated by equation (D.2) – (D.3).

$$A = \frac{(e-d)}{\rho_a}$$

(D.2)

where A is the volume of acetone added into pyncometer ( $\text{cm}^3$ ),  $\rho_a$  is the specific density of acetone ( $\text{g.cm}^{-3}$ ), e is the weight of the pyncometer with acetone and Ppy powders (g), and d is the weight of Ppy powder and the pyncometer (g).

$$\rho_p = \frac{(d-b)}{25-A} \quad (D.3)$$

where  $\rho_p$  is the specific density of Ppy ( $\text{g}\cdot\text{cm}^{-3}$ ),  $d$  is the weight of Ppy powder, pyncometer (g),  $b$  is the weight of the blank pyncometer (g), and  $A$  is the volume of acetone added into the pyncometer ( $\text{cm}^3$ ).

**Table D1** The data of the determination specific density of water and Ppy at 298K.

Specific density ( $\text{g}/\text{cm}^3$ )	Measure ( $\text{g}/\text{cm}^3$ )			average	SD
	1	2	3		
Acetone	0.9668	0.9664	0.9668	0.966667	0.000231
Ppy	1.272091	1.265039	1.282921	1.27335	0.009007

### Appendix E Identification Thermal Property of Undoped, Doped Ppy and Pure Elastomer.

Undoped and doped poly(pyrrole) (Ppy) at various ratios of monomer to dopant unit were determined by a thermal gravimetric analyzer (DT-TGA 1790). Measurements were taken with the temperature scans from 60 to 1000°C and a heating rate of 10°C/min. The samples were weighed in the range of 1-5 mg and loaded into a platinum pan, and then were heated under N<sub>2</sub> flow. From figure E1, the transitions can be observed for undoped and doped poly(pyrrole). The first transition refers to the losses of residue solvent and water. The second transition refers to the Ppy\_U side chain degradation, and the third transition refers to the Ppy backbone degradation. After doping, the thermal stability improved as compared to that of undoped Ppy.

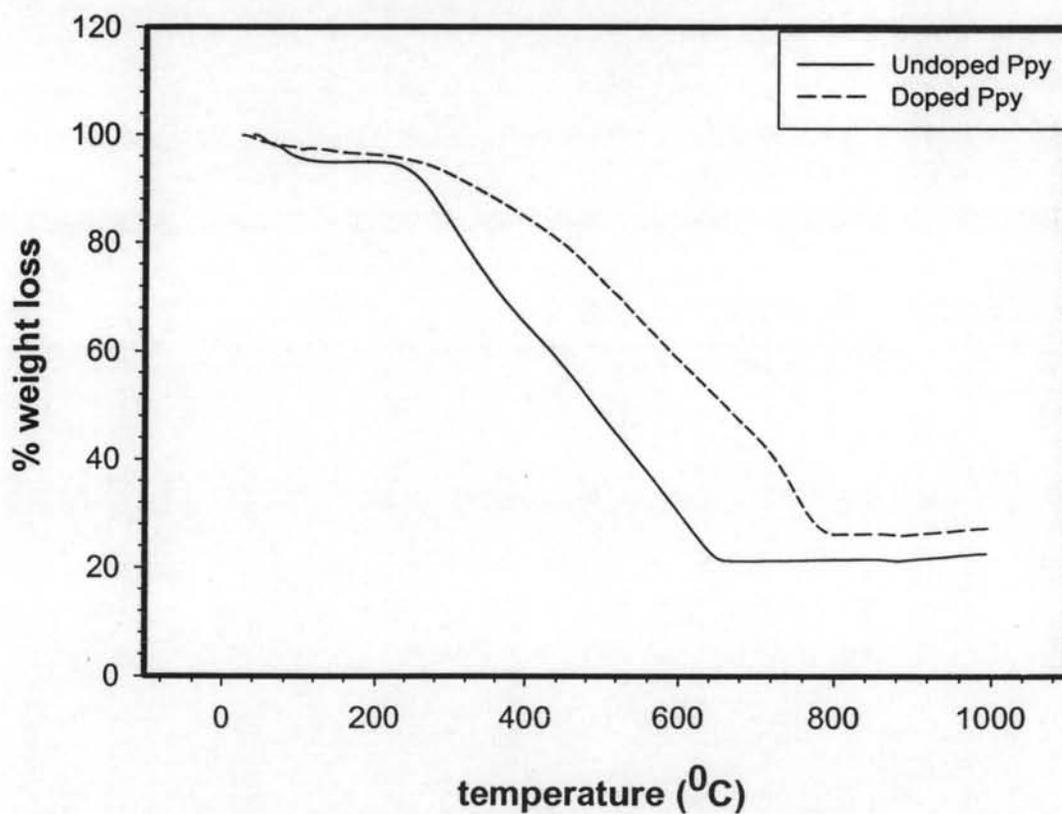

**Table E1** Summary of Undoped and doped Ppy degradation step

sample	Transititon temperature (°C)			% Weight loss			%Residue
	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	
Ppy_U	60-172	172-312	312-1000	5.1	13.8	59.2	22.56
Ppy_1:1	60-105	105-356	356-1000	2.7	8.9	62.1	27.26

PDMS, AR, SAR, AR71, AR72HF, SIS, and SBR were also characterized by a thermal gravimetric analyzer (DT-TGA 1790). Measurements were taken with the temperature scans from 60 to 500 °C and a heating rate of 10°C/min. The samples were weighed in the range of 15-25 mg and loaded into a platinum pan, and then were heated under N<sub>2</sub> flow. All of elastomer matrices show only one transition that can be referred to as the backbone degradation. From Figure E2, most of materials rapidly lost their weights at about 400 °C. The degradation temperature of PDMS is higher than others.

**Table E2** Summary of various elastomer degradation temperatures

Sample	Transitions temperature( C0)	% Weight loss	% Residue
AR70	365-409	72.25	3.03
AR71	365-400	78.77	1.08
AR72	363-419	71.92	8.65
PDMS	444-511	78.11	0.45
SAR	371-417	78.06	0
SBR	372-468	78.06	2.2
SIS	421-482	78.18	0

## Appendix F Specification of the elastomer matrices

### F.1 Poly(dimethylsiloxane), hydroxy terminated (PDMS, Aldrich 432997)

Table F1 Properties of poly(dimethylsiloxane)

Properties	Typical value
Boiling point	93 °C
Density	0.97 g/ml at 25 °C
Viscosity	18,000-22,000 cSt

### F.2 Styrene acrylate copolymer rubber latex (SAR, Dow chemical Latex T – 3356 F)

Table F2 Physical and chemical properties of styrene acrylate copolymer

Properties	Typical value
Physical state	Fluids
Color	White
Odour	Mild
Molecular weight	Mixture
Boiling Point	100 °C
Freezing Point	0 °C
Melting point	Not applicable
Flash point	Not applicable (aqueous system)
Flammable limits	Lower: not applicable(aqueous system)
In air (% by volume)	Upper: not applicable(aqueous system)
Specific gravity (H <sub>2</sub> O=1)	1.1
Vapour pressure	same as water
Vapour density (air = 1)	< 1
Evaporation rate (butyl acetate = 1)	is slower than butyl acetate

## F.3 Styrene butadiene copolymer rubber latex (SBR, Dow Chemical DL 849)

Table F3 Physical and chemical properties of styrene butadiene latex

Properties	Typical value
Solubility in water	as emulsion is misible with water
Boiling point	100 °C
Appearance	milky white liquid emulsion
Odour	practically odourless
Freezing point/	0 °C (relates to water component )
Specific gravity (H <sub>2</sub> O=1)	0.98-1.040
pH value	5.0-8.0
Vapour pressure	17.5 mmHg @ 20 °C (relates to water component )
Vapour density	0.624 at 27 °C (relates to water component )
Solids content	52 %
pH	7.7
RVT Brookfield viscosity (#2, 50 rpm.)	<700 m.Pa.S
Particle size	140 nm
Stabilizer	anionic
Glass transition temperature (T <sub>g</sub> )	-7 °C
Antioxidant	Present
200 mesh residue	<0.5 g/l
Mechanical stability	Excellent
Hand	Medium soft
Adhesion (on fabric)	43 N/50 mm

## F.4 Acrylate copolymer rubber latex (AR, Dow chemical Latex R 7018)

Table F4 Physical and chemical properties of acrylate copolymer

Properties	Typical value
Physical state	Fluids
Color	White
Odour	Mild
Molecular weight	Mixture
Boiling Point	100 °C
Freezing Point	0 °C
Melting point	Not applicable
Flash point	Not applicable (aqueous system)
Flammable limits	Lower: not applicable(aqueous system)
In air (% by volume)	Upper: not applicable(aqueous system)
Specific gravity (H <sub>2</sub> O=1)	1.1
Vapour pressure	Same as water
Vapour density (air = 1)	< 1
Solubility in water	Dilutable
Evapouration rate (butyl acetate = 1)	Is slower than butyl acetate
Percent volatiles	51 wt%(water)

## F5 Acrylate copolymer ( Nipol AR71 and Nipol AR72HF, Nipon Zeon Advance Polymix Co.,LTD )

Table F5 Physical and chemical properties of Acrylate copolymer (AR71 and AR72)

Property	AR71	AR72 HF
Elongation(%)	400	230
Volatile matter (%)	0.32	0.56
Tensile Strength (MPa)	11.8	11.2
100% Modulus (MPa)	4.1	6
Ash (%)	0.22	0.16
Moony Viscosity at 100 °C	50	48
Glass Transition C	-15	-28
Specific Gravity	1.11	1.11
Type	Heat resistance	Low Temperature resistance

## F.6 Styrene isoprene styrene copolymer rubber latex (SIS, Shell Chemicals D113P)

Table F6 Physical and chemical properties of Styrene isoprene styrene copolymer

Property	Value	Unit	Method
Tensile strength	600	psi	ASTM D412 tensile tester jaw separation speed 10in/min
300 % Modulus	50	%	ASTM D412 tensile tester jaw separation speed 10in/min
Elongation	1,500	%	ASTM D412 tensile tester jaw separation speed 10in/min
Set at break	20	%	-
Hardness, Shore A (10 sec) <sup>3</sup>	23	-	-
Brookfield Viscosity (Toluene Solution), cps at 77 °F	600	-	-
Specific Gravity	0.92	-	Neat polymer concentration, 25%w.
Melt Index	24	gms/10 min	200 °C, 5 kg
Plasticizer Oil Content	0	%w.	-
Styrene/Rubber Ratio	16/84	-	-
Plastic Form	Pellet	-	-
Diblock	55	%	-

### Appendix G Determination of the Correction Factor (K)

The electrical conductivity of undoped and doped Ppy was measured by a two-point probe meter. The meter consists of two probes, making contact on the surface of film sample. These probes were connected to a source meter (Keithley, Model 6517A) for a constant voltage source and for reading the resultant current.

The geometrical correction factor was taken into account of geometric effects, depending on the configuration and probe tip spacing.

$$K = \frac{w}{l}$$

(E.1)

K is geometrical correction factor, w is the width of probe tip spacing (cm), l is the length between probes (cm).

In this measurement, the constant K value was determined by using standard materials where specific resistivity values were known; we used silicon wafer chips (SiO<sub>2</sub>). In our case, the sheet resistivity was measured by using our custom made two-point probe and then the geometric correction factor was calculated by equation (E.2) as follows:

$$K = \frac{\rho}{R \times t} = \frac{I \times \rho}{V \times t}$$

(E.2)

K is the geometric correction factor, ρ is the resistivity of a standard silicon wafer, calibrated by using a four point probe at King Mongkut's Institute Technology of Lad Krabang (Ω.cm), t is the film thickness (cm), R is the film resistance (Ω), I is the measured current (A), and V is the voltage drop (V).

Standard Si wafer were cleaned to remove organic impurities prior to be used according to the standard RCA method (Kern, 1993).

## Materials

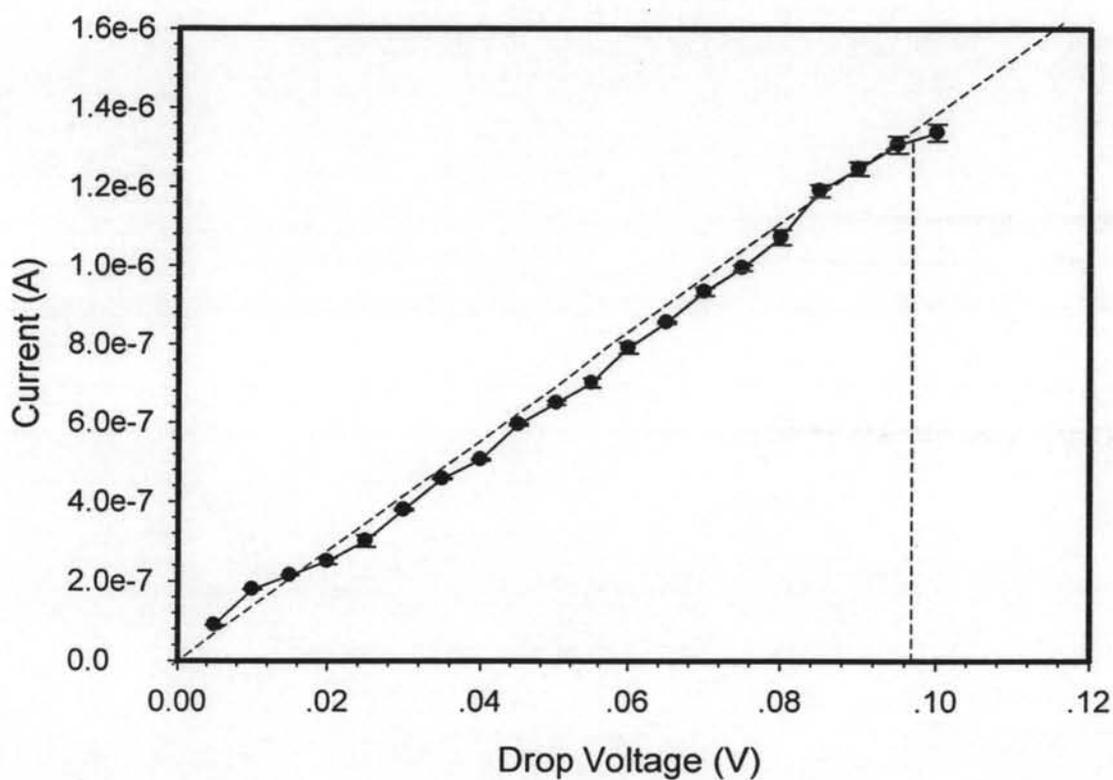

Acetones (Scharlau, 99.5%), Methanol (CARLO ERBA, 99.9%), Ammonium hydroxide (Merk, 99.9%), Hydrogen peroxide (CARLO ERBA, 30% in water), and dilute (2%) Hydrofluoric acid

## Experiment

The cleaning procedures contain 3 steps: the solvent clean, the RCA01 and the HF dip. The first step is the solvent clean step, employed to remove oils and organic residues that appeared on Si wafer surface. The Si wafer was placed into the acetone at 55°C for 10 min, removed and placed in methanol for 2-5 min, subsequently rinsed with deionized water and blown dried with nitrogen gas. Second step is the RCA clean, to remove organic residues from silicon wafers. This process oxidized the silicon wafer and left a thin oxide on the surface of the wafer. RCA solution was prepared with 5 parts of water (H<sub>2</sub>O), 1 part of 27% ammonium hydroxide (NH<sub>4</sub>OH), and 1 part of 30% hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>). 65 ml of NH<sub>4</sub>OH (27%) was added into 325 ml of deionized water in a beaker and then heated to 70 ± 5°C. The mixture would bubble vigorously after 1-2 min, indicated that it was ready to use. Silicon wafer was soaked in the solution for 15 min, consequently overflowed with deionized water in order to rinse and remove the solution. The third step is the HF dip, which was carried out to remove native silicon dioxide from wafer. 480 ml of deionized water was added to the polypropylene bottle and then added to 20 ml HF. Wafer was soaked in this solution for 2 min, removed and checked for hydrophobicity by performing the wetting test. Deionized water was poured onto the surface wafer; the clean silicon surface would show that the beads of water would roll off. Clean Si wafer was further blown dried with nitrogen and stored in a clean and dry environment.

**Table G1** Determination the geometrical factor of probe A

Probe	K (correction factor)				
	1	2	3	Average	STD
A	4.88E-06	4.92E-06	4.94E-06	4.92E-06	1.62E-07

## Appendix H Conductivity Measurement

The specific conductivity, which is the inversion of specific resistivity ( $\rho$ ) of undoped and doped Ppy pellets was measured by using the two-point probe connected to a source meter (Keithley, Model 6517A) for a constant voltage source and for reading resultant current under the atmospheric pressure, 54-60% relative humidity and 24-25°C. The geometric correction factor (K) of probe A is  $1.23 \times 10^{-5}$ . The thickness of pellets was measured by a thickness gauge. The applied voltage was plotted versus the current change to determine the linear ohmic regime of each sample. The applied voltage and the current change in the linear ohmic regime were converted to the electrical conductivity of the polymer by using equation (H.1) as follows:

$$\sigma = \frac{1}{\rho} = \frac{1}{R_s \times t} = \frac{I}{K \times V \times t} \quad (\text{H.1})$$

Where  $\sigma$  is the specific conductivity (S/cm),  $\rho$  is the specific resistivity ( $\Omega \cdot \text{cm}$ ),  $R_s$  is the sheet resistivity ( $\Omega$ ),  $I$  is the measured current (A),  $K$  is the geometric correction factor,  $V$  is the applied voltage (voltage drop) (V),  $t$  is the pellet thickness (cm).

In addition, the conductivity of matrixes can be measured by using the resistivity testing fixture (Keithley, Model 8009) connected to a source meter (Keithley, Model 6517A) for a constant voltage source and for reading resultant current under the atmospheric pressure, 54-60% relative humidity and 24-25°C. The conductivity of matrixes was calculated by using equation (H.2 – H.3) as follows:

$$K_v = \pi \times \frac{(D + [\beta \times g])^2}{4} \quad (\text{H.2})$$

Where  $K_v$  is the effective area of the guarded electrode for the particular electrode arrangement employed ( $\text{cm}^2$ ),  $D$  is the diameter of the guarded electrode (cm),  $\beta$  is the effective area coefficient ( $\text{cm}^2$ ) ( $\beta$  is always zero),  $g$  is the distance between the guarded electrode and the ring electrode (cm):

$$\sigma = \frac{1}{\rho} = \frac{t \times I}{22.9 \times V} \quad (\text{H.3})$$

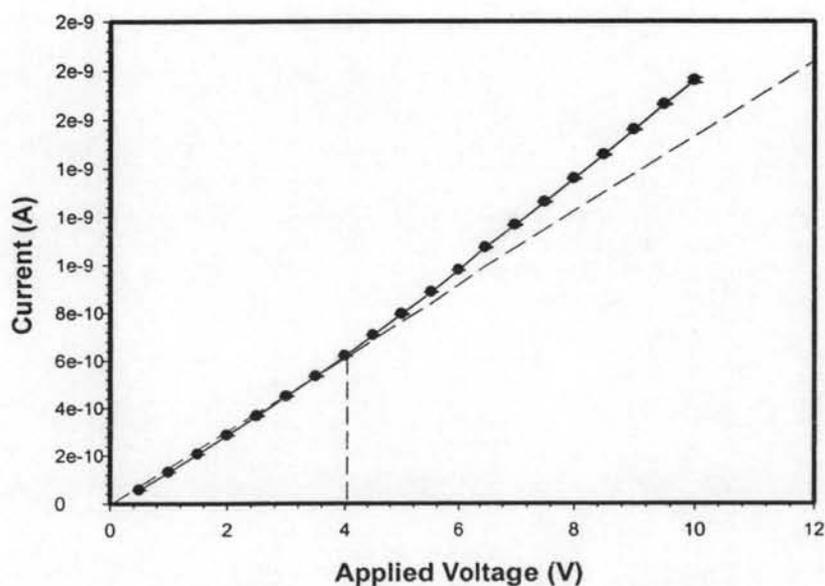

Where  $\sigma$  is the specific conductivity (S/cm),  $\rho$  is the specific resistivity ( $\Omega \cdot \text{cm}$ ),  $I$  is the measured current (A),  $V$  is the applied voltage (voltage drop) (V),  $t$  is the sheet thickness (cm).

### Appendix I Identification of Crystallinity of Undoped and Doped Ppy.

Powder of Ppy was packed on the glass plate and taken into X-ray Rigaku, mode 1860. The data were collected after X-ray passed through the sample. Properties of Ppy can be investigated by the peaks of graph. The characteristic peaks were determined in range  $2\theta$  between  $5 - 35^\circ$  as shown in Figure I1. The d-spacing between molecules can be calculated by use this equation.

$$n\lambda = 2d\sin\theta \quad (1.1)$$

where  $n$  is number,  $\lambda$  is wavelength of X-ray source,  $d$  is d-spacing,  $\theta$  is angle that peaks appeared.

Figure I1 XRD Patterns of undoped and doped Ppy

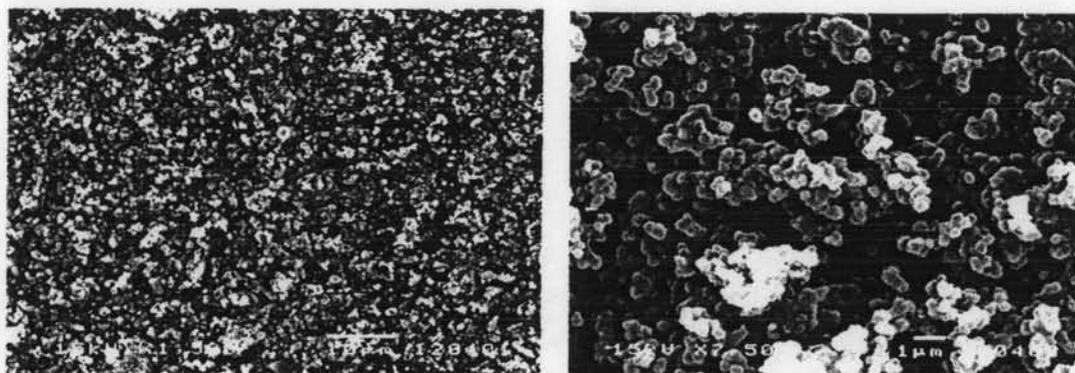

**Table II** shows the raw data of characteristic peaks and d-spacing of Ppy of undoped and doped polypyrrole from  $2\theta = 15-30^\circ$ . For doped polypyrrole, the peak at  $20^\circ$  can refer to the polypyrrole-counter ion or inter-counter ion interaction scattering (Song, M.K.2006) and The intensity of high angle peak at  $26^\circ$  is related to interplanar distance of pyrrole –pyrrole and polypyrrole-counter ion .

**Table II** XRD raw data of undoped and doped Ppy

	$2\theta$ ( $^\circ$ )	d-spacing ( $\text{A}^\circ$ )	Intensity
Undoped			
	26.26, 26*	3.39, 3.42*	2488
Doped Ppy			
	20.32, 20*	4.37, 4.48*	3111
	26.06, 26*	3.42, 3.42*	1774

\*Note: Values from Song *et al.*, 2004

### Appendix K Electrorheological Properties Measurement of Pure Elastomer Matrix

The electrorheological properties of various pure elastomer matrices were measured by the melt rheometer (Rheometric Scientific, ARES) under oscillatory shear mode and applied electric field strength varying from 0 to 2 kV/mm. In these experiments, the dynamic moduli ( $G'$  and  $G''$ ) were measured as functions of frequency and electric field strength. Strain sweep tests were first carried out to determine the suitable strain to measure  $G'$  and  $G''$  in the linear viscoelastic regime

#### K.1) Acrylate copolymer rubber latex (AR 70)

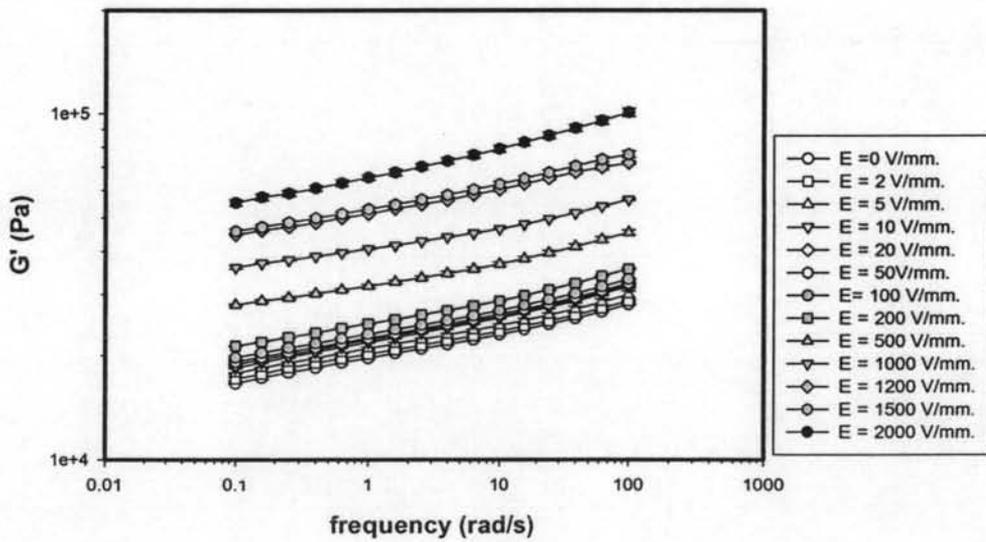

(a)

All of materials was tested at frequency =1 rad/s, strain 1% and, temperature = 27 °C except AR 71, 0.1%, AR 72, 0.1% were tested at strain 0.1% and PDMS 700% was tested at strain 700%

\*films were formed by water solution casting, \*\* films were formed by acetone solution casting.

\*\*\* films were formed by toluene solution casting.

$G'_0$ , and  $G''_0$  is storage and loss modulus without electric field

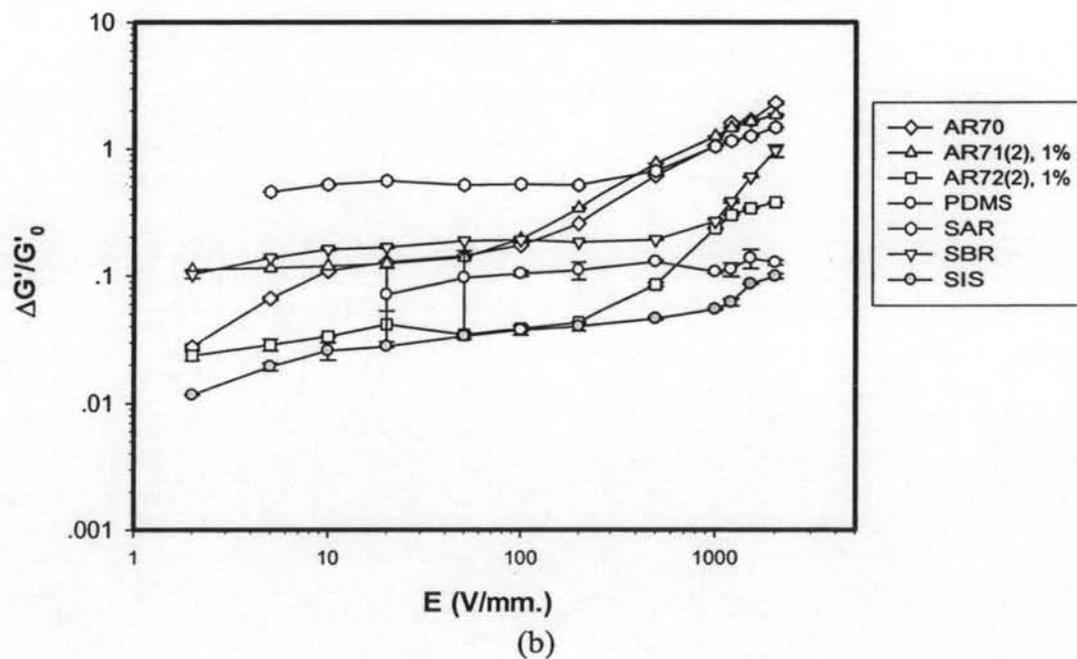

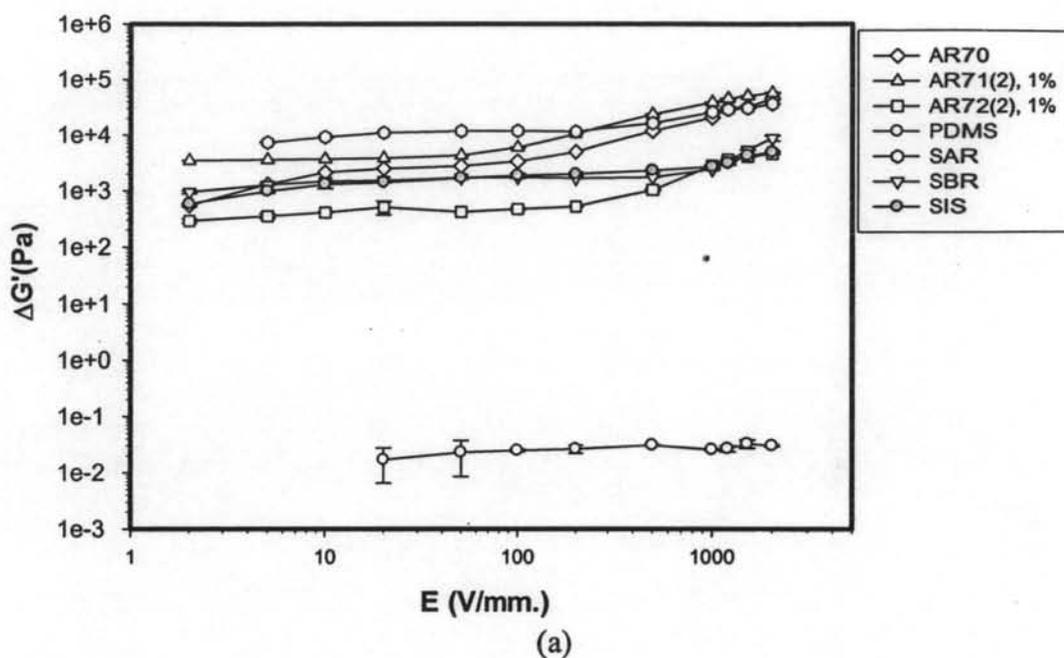

$G'_{1kV}$  is storage modulus at 1 kV/mm,  $G'_{2kV}$  and  $G''_{2kV}$  are storage and loss modulus at 2 kV/mm.

$\Delta G'_{1kV}$  is the the storage modulus responses between  $G'_0$  and  $G'_{1kV}$

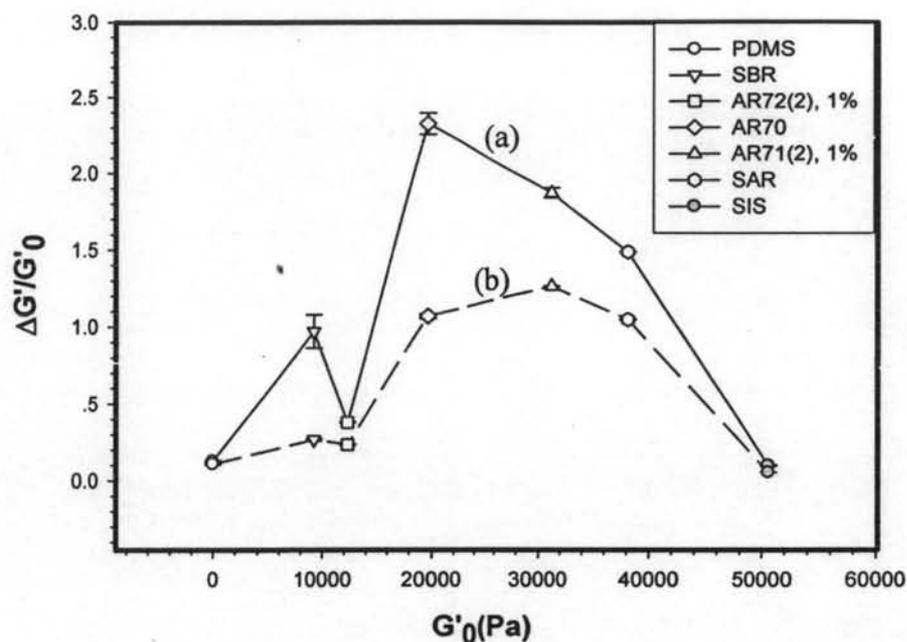

$\Delta G'_{2kV}$  is the the storage modulus responses between  $G'_0$  and  $G'_{2kV}$

$\Delta G''_{2kV}$  is the the loss modulus responses between  $G''_0$  and  $G''_{2kV}$ ,  $\Delta G'_{1kV}/G'_0$  is sensitivity of the storage modulus at 1 kV,

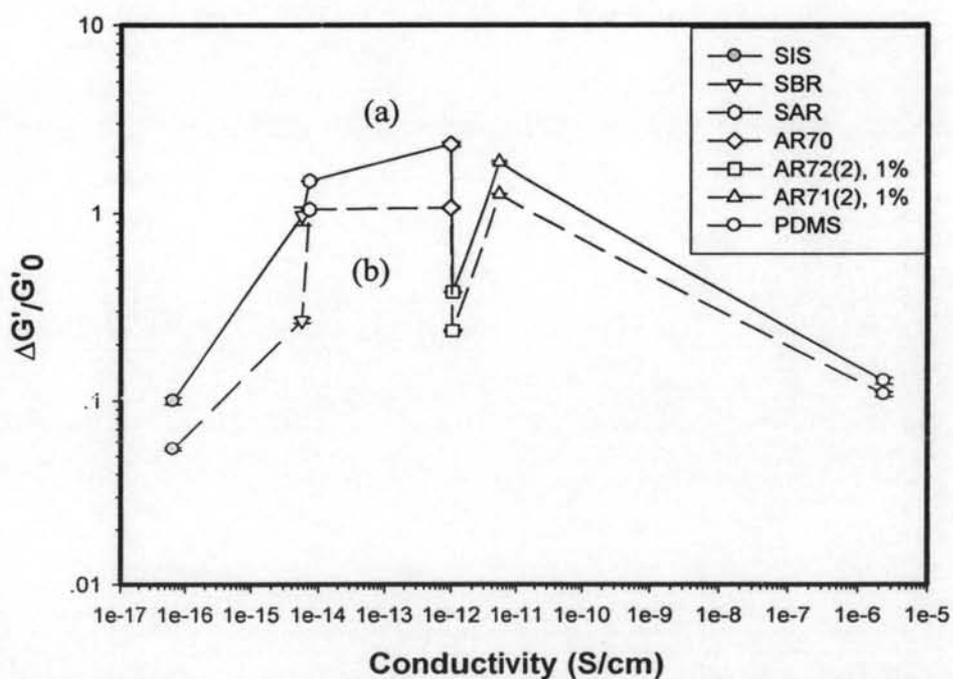

$\Delta G'_{2kV}/G'_0$  is sensitivity of the storage modulus at 2 kV,  $\Delta G''_{2kV}/G''_0$  is sensitivity of the loss modulus at 2 kV

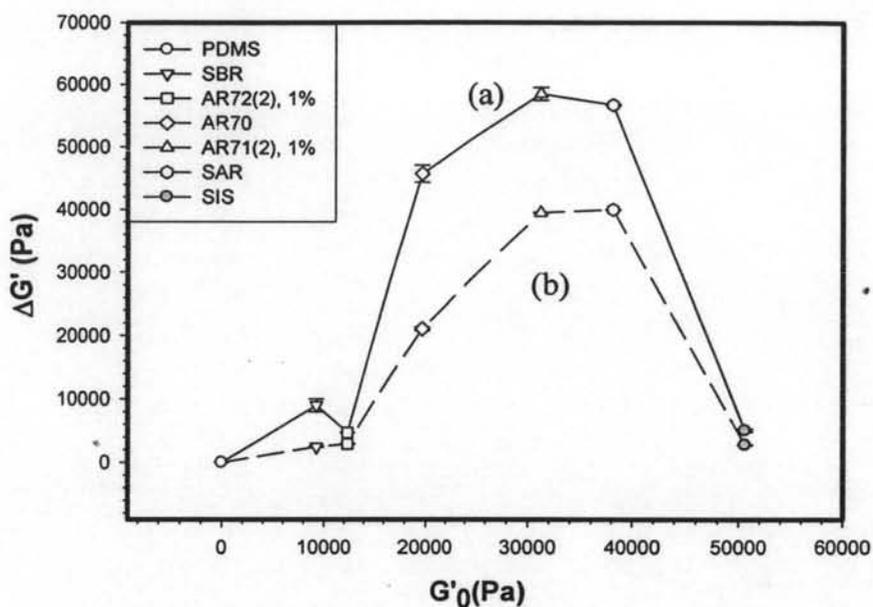

**Figure K16** Effect of matrices on: (a) the storage modulus responses ( $\Delta G'$ ) and (b) storage modulus sensitivity ( $\Delta G'/G'_0$ ) vs. electric fields strength: 0 to 2 KV/mm at frequency 1 rad/s, strain 1%(except PDMS was tested at 700%), and at 27 °C.

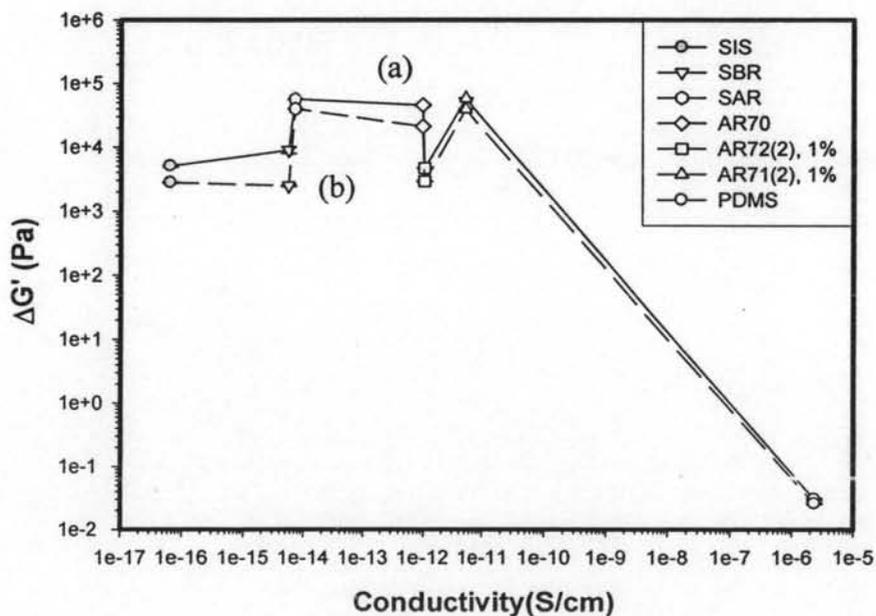

**Figure K17** sensitivity vs.  $G'_0$ , strain 1.0%(except PDMS was tested at 700%), frequency 1.0 rad/s, and 27 °C at: (a) solid line, 2 kV; (b) dash line, 1 kV.

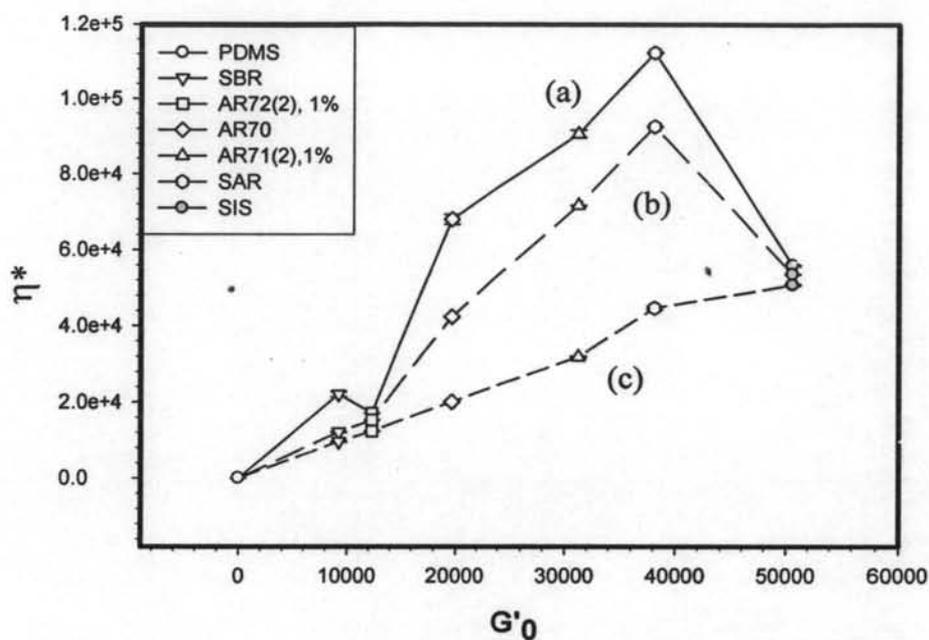

**Figure K18** sensitivity vs. conductivity, strain 1.0%(except PDMS was tested at 700%), frequency 1.0 rad/s, and 27°C at: (a) solid line, 2 kV; (b) dash line, 1 kV.

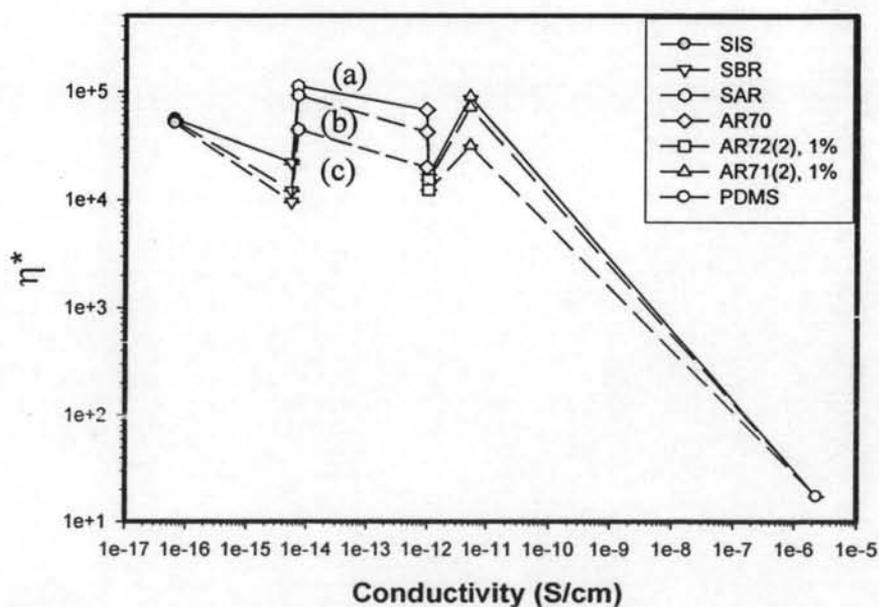

**Figure K19** the storage modulus responses ( $\Delta G'$ ) vs.  $G'_0$ , strain 1.0%(except PDMS was tested at 700%), frequency 1.0 rad/s, and 27 °C at: (a) solid line 2 kV; (b) dash line 1 kV.

**Figure K20** the storage modulus responses ( $\Delta G'$ ) vs.  $G'_0$ , strain 1.0%(except PDMS was tested at 700%), frequency 1.0 rad/s, and 27 °C at: (a) solid line, 2 kV; (b) dash line, 1 kV.

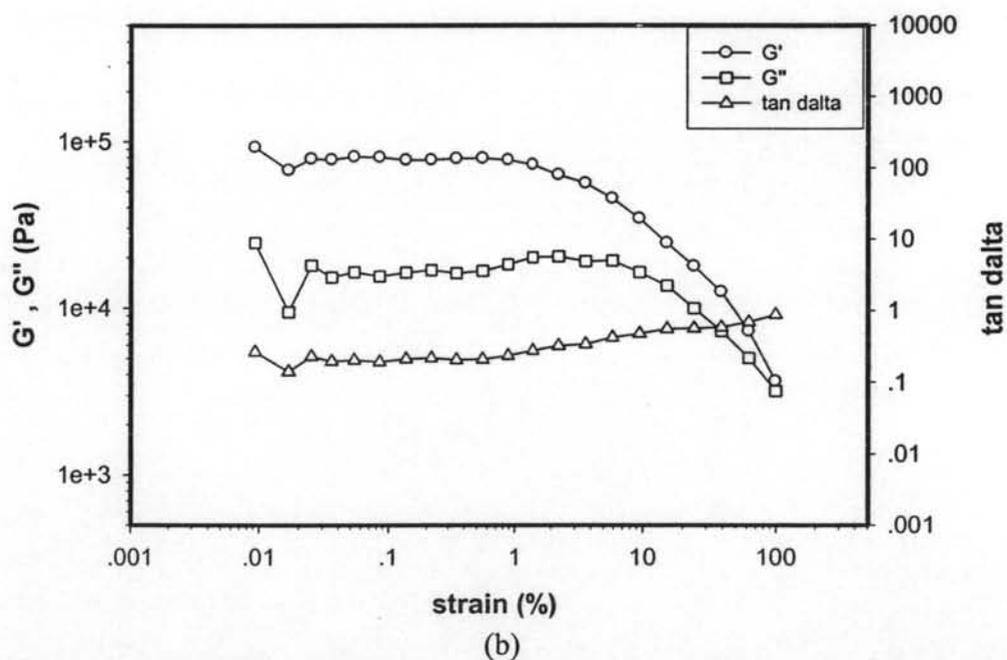

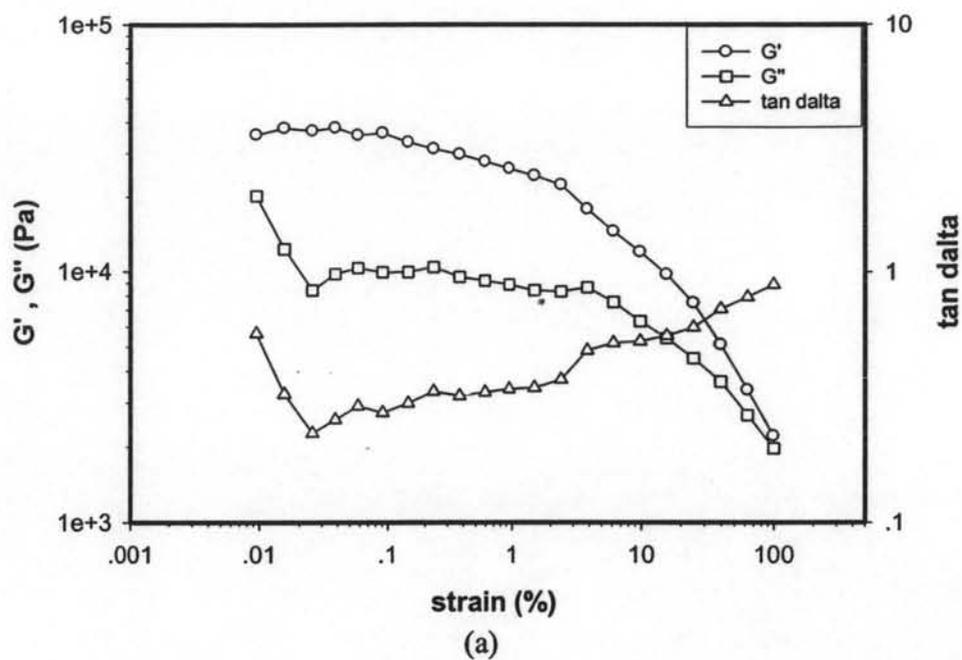

**Figure K21** the  $\eta^*$  vs.  $G'_0$ , strain 1.0% (except PDMS was tested at 700%), frequency 1.0 rad/s, and 27 °C at: (a) solid line, 2 kV; (b) long dash line, 1 kV; (c) medium dash line, 0 kV.

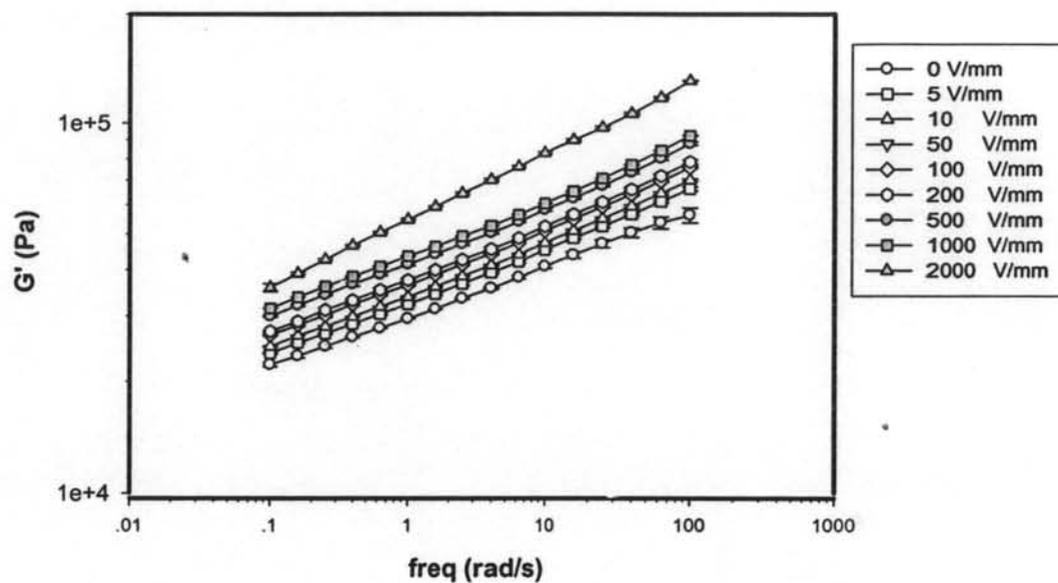

**Figure K22** the  $\eta^*$  vs.  $G'_0$ , strain 1.0% (except PDMS was tested at 700%), frequency 1.0 rad/s, and 27 °C: at (a) solid line, 2 kV; (b) long dash line, 1 kV; (c) medium dash line, 0 kV.

**Appendix L Electrorheological Properties Measurement of Polymer Blends between Ppy and AR70 at Various ratio of Ppy.**

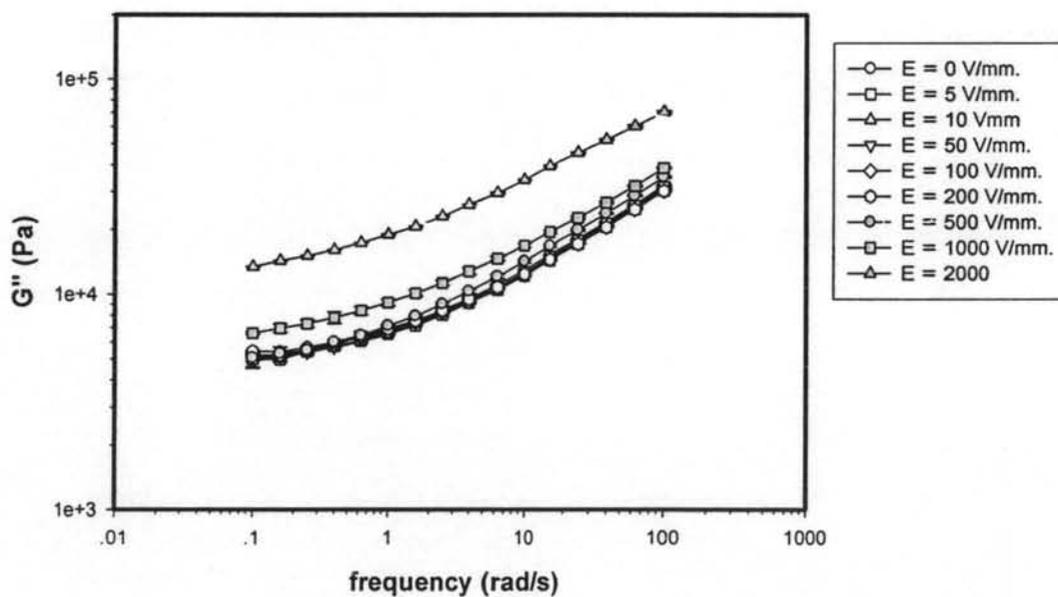

The electrorheological properties of polymer blends between Ppy and AR70 at various ratio of Ppy were measured by the melt rheometer (Rheometric Scientific, ARES) under oscillatory shear mode and applied electric field strength varying from 0 to 2 kV/mm. In these experiments, the dynamic moduli ( $G'$  and  $G''$ ) were measured as functions of frequency and electric field strength. Strain sweep tests were first carried out to determine the suitable strain to measure  $G'$  and  $G''$  in the linear viscoelastic regime.

**Figure L1** Strain sweep test of polymer blend between Ppy and AR70 at 1% v/v of Ppy (AR70:1\_un), frequency 1.0 rad/s,  $27^{\circ}$  C, gap 0.650 mm at: a)  $E = 0$  V/mm; b)  $E = 2000$  V/mm.
