

CHAPTER VI

RECOMMENDATIONS

6.1 Recommendation for Glyphosate and Chemical Fertilizer Application

According to the results from this study, to use glyphosate and chemical fertilizer by safe environment, we suggest that the suitable timing for chemical fertilizer application is at least 2 weeks after glyphosate application.

6.2 Recommendations for Future Work

Based on the results of this study, some recommendations for further studies can be proposed.

1. The influence of different soil characteristics on glyphosate leaching should be studied in order to predict the leaching ability of glyphosate among difference soil types.
2. Different chemical fertilizer formulas should be studied to compare the ways in which they affect the accumulation of glyphosate in soil.
