APPENDICES

Appendix A : Figures

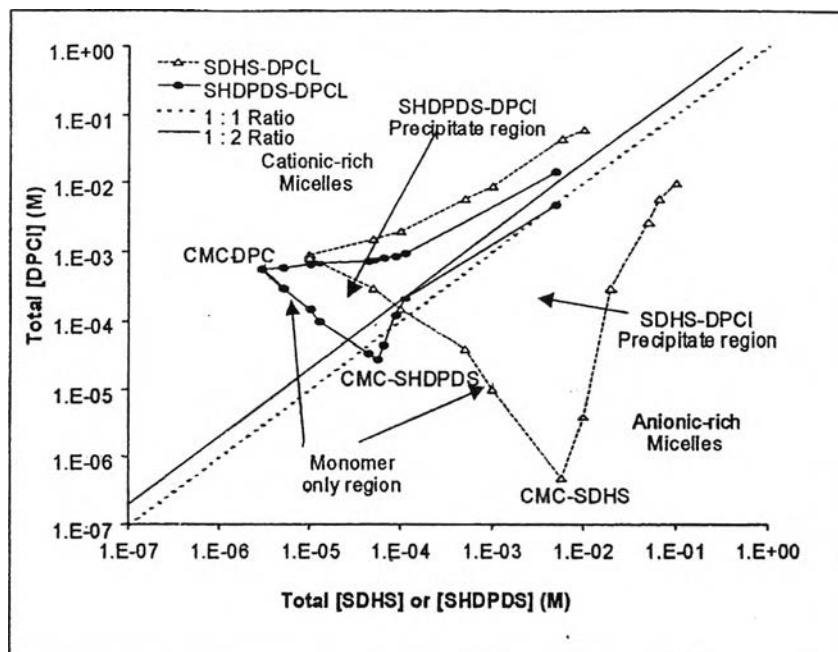

Figure 1.1 Precipitation diagram of mixed anionic and cationic surfactants for SHDPDS and DPC system (Doan et al., 2002)

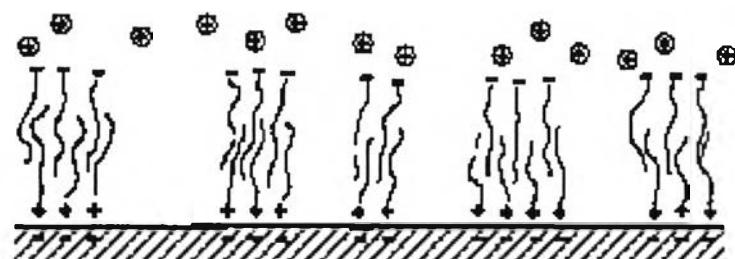

Figure 1.2 Schematic representation of the mixed anionic and cationic surfactant bilayer at the laponite-water interface (Capovilla et al., 1996)

Appendix B : Equations

1.1 Adsorption isotherm

Equation 2.1 was used to calculate the adsorption of the surfactant on the mineral oxide surface. In this equation, adsorption of water or salt is negligible and the adsorption of surfactant has no effect on the solution density (Lopata, 1988).

$$\Gamma_i = \frac{(C_{i,b} - C_{i,a})V}{W_g} \quad (2.1)$$

where;

- Γ_i = Adsorption of surfactant i (mole/g)
- V = Volume of sample (liter)
- $C_{i,b}$ = Concentration of surfactant at initial (mole/liter)
- $C_{i,a}$ = Concentration of surfactant at equilibrium (mole/liter)
- W_g = Weight of aluminum oxide (g)

1.2 Molecule per area

$$q = \frac{1g}{Am^2} \times \frac{(6.023 \times 10^{23} \text{ molecules})}{\text{mole}} \times \frac{1m^2}{10^{18} nm^2}$$

A = Surface area of alumina ($133 g/m^2$)

1.3 Micellar partition coefficient

$$K_{\text{mic}} = \frac{X_{\text{mic}}}{X_{\text{aq}}} \quad (4.1)$$

where;

X_{mic} is the mole fraction of the organic solute in the micelle pseudo-phase.

X_{aq} is the mole fraction of the organic solute in the aqueous phase. They are calculated as

$$X_{\text{mic}} = \frac{C_0 - C_{\text{eq}}}{(C_0 - C_{\text{eq}}) + (S_0 - S_{\text{eq}})} \quad (4.2)$$

$$X_{\text{aq}} = \frac{C_{\text{eq}}}{C_{\text{eq}} + 55.55} \quad (4.3)$$

where;

C_0 is the concentration of organic solute at initial

C_{eq} is the concentration of organic solute at equilibrium

S_0 is the concentration of surfactant at initial

S_{eq} is the concentration of organic solute at equilibrium

55.55 represent 1 molar of water

The partitioning of organic solute is described by the molar solubilization ratio (MSR) which is the slope of the solubilization isotherm beyond the CMC value. MSR indicates the mole of organic solute per mole of micellar surfactant. The mole fraction of the organic solute in micelle is related to MSR by simple relation (Rouse et al., 1995).

$$X_{\text{mic}} = \frac{\text{MSR}}{(1 + \text{MSR})} \quad (4.4)$$

$$K_{\text{mic}} = \frac{\text{MSR}/(1 + \text{MSR})}{C_{\text{eq}}/(C_{\text{eq}} + 55.55)} \quad (4.5)$$

1.4 Admicellar partition coefficient

Admicellar partition coefficient (K_{adm}) is defined analogous to micellar partition coefficient (Nayyar et al., 1994).

$$K_{adm} = \frac{X_{adm}}{X_{aq}} \quad (4.6)$$

where X_{adm} is the molar fraction of organic solute in the admicelle phase

X_{aq} is the molar fraction of organic solute in the aqueous phase

For this study, they are calculated as:

$$X_{adm} = \frac{(C_{i,sty} - C_{f,sty})}{(C_{i,sty} - C_{f,sty}) + (S_{i,AIS} + S_{f,AIS}) + (S_{i,CIS} + S_{f,CIS})} \quad (4.7)$$

where

- X_{adm} = Molar fraction of organic solute in admicelle
- $C_{i,sty}$ = Initial concentration of organic solute (M)
- $C_{f,sty}$ = Final concentration of organic solute (M)
- $S_{i,AIS}$ = Initial concentration of anionic surfactant, (M)
- $S_{f,AIS}$ = Final concentration of anionic surfactant, (M)
- $S_{i,CIS}$ = Initial concentration of cationic surfactant, (M)
- $S_{f,CIS}$ = Final concentration of cationic surfactant, (M)

BIOGRAPHY

Miss Ampira Charoensaeng was born in Bangkok, Thailand, on 21 March 1980. In year 2001, she graduated in Bachelor of Science, Department of General Science, Faculty of Science at Chulalongkorn University, Bangkok, Thailand. At the time of this study, she was an M.S. student with a major in Environmental Management at the National Research Center for Environmental and Hazardous Waste Management (NRC-EHWM), Chulalongkorn University, Bangkok, Thailand.
