ABSTRACT

4472018063 : POLYMER SCIENCE PROGRAM

Phomphon Srimoan : Shear-Induced Crystallization in
Poly(trimethylene terephthalate).

Thesis Advisor : Asst. Prof. Pitt Supaphol, Assoc. Prof. Anuvat
Sirivat, 189 pp. ISBN 974-17-2337-7

Keywords : Poly(trimethylene terephthalate)/Shear-Induced Crystallization/
Crystallization Kinetics

In plastics processing, polymer melts are generally sheared (i.e., they undergo shear flow) which may or may not enhance crystallization rates depending on the favored conformational state of polymer molecules in the crystals. Poly(trimethylene terephthalate) (PTT) is a new type of polyester that has recently been commercialized as a result of the low production cost. In this work, shear-induced crystallization in PTT was investigated from both the melt and the glassy states and in both isothermal and non-isothermal regimes using differential scanning calorimetry technique. In cold crystallization, shear-treated samples were prepared using cone-and-plate and capillary rheometers. The cold crystallization peak temperature for shear-treated samples was also shifted to lower temperatures. A modified differential Nakamura model, which takes into account the effect of shear, was used to analyze the data. A cone-and-plate rheometer was used to investigate the *in situ* shear-induced melt crystallization in PTT. A simplified model describing the effect of shear on the shift in the induction time was used to analyze the data.

บทคัดย่อ

พรพล ศรีโมอ่อน : การศึกษาพฤติกรรมการตกผลึกของพอลิ(ไตรเมทิลีนเทเรฟทาเลท)ที่ถูกเหนี่ยวนำโดยการเฉือน (Shear-Induced Crystallization of Poly(trimethylene terephthalate) อ. ที่ปรึกษา : ผศ.ดร. พิชญ์ สุภผล และ รศ.ดร.อนุวัฒน์ ศิริวัฒน์ 189 หน้า ISBN 974-17-2337-7

ในสภาวะการขึ้นรูป ปกติพอลิเมอร์หลอมเหลวจะถูกเฉือนภายใต้แรงเฉือนซึ่งอาจจะเพิ่มอัตราการตกผลึก หรือ เหนี่ยวนำการตกผลึกขึ้นอยู่กับสภาวะการจัดเรียงตัวของพอลิเมอร์โมเลกุลในผลึก พอลิไตรเมทิลีนเทเรฟทาเลท เป็นพอลิเอสเทอร์ชนิดใหม่ที่เหมาะสมในทางการค้าเมื่อไม่นานนี้เนื่องจากต้นทุนในการผลิตที่ต่ำลง ในการศึกษาครั้งนี้ การตกผลึกของพอลิไตรเมทิลีนเทเรฟทาเลทที่ผ่านการเฉือนถูกติดตามโดยใช้เทคนิค differential scanning calorimetry (DSC) ในสภาวะการตกผลึกแบบเย็น ตัวอย่างที่ผ่านการเฉือนถูกเตรียมโดยใช้ cone and plate rheometer และ capillary rheometer อุณหภูมิสูงสุดของการตกผลึกแบบเย็นพบว่า สามารถเกิดที่อุณหภูมิต่ำกว่าเมื่อเปรียบเทียบกับตัวอย่างที่ไม่ผ่านการเฉือน แบบจำลองที่มีการปรับปรุงของ Nakamura ที่คำนึงถึงปัจจัยของการเฉือนถูกนำมาใช้ในการวิเคราะห์ผลการทดลอง cone and plate rheometer สามารถใช้ในการติดตามการตกผลึกของตัวอย่างในสภาวะการตกผลึกจากหลอมเหลว แบบจำลองอย่างง่ายที่พิจารณาว่า ผลของการเฉือนสามารถเหนี่ยวนำช่วงเวลาที่ใช้ก่อนการตกผลึกถูกใช้อธิบายผลการทดลองด้วย

ACKNOWLEDGEMENTS

The author is grateful for the partial scholarship and partial funding of the thesis work provided by Postgraduate Education and Research Programs in Petroleum and Petrochemical Technology (PPT Consortium). The author would like to express the grateful appreciation to the author advisors, Asst. Prof. Pitt Supaphol and Assoc. Prof. Anuvat Sirivat for their intensive suggestion, invaluable guidance and vital help throughout this research work.

The authors wish to thank Dr. Hoe H. Chuah and his co-workers of Shell Chemical Company (USA) Ltd. for supply and assistance on molecular weight measurements of PTT.

The author would like to sincerely thank all the staff of the Petroleum and Petrochemical College, Chulalongkorn University for their assistance and in helping the author to use the research facilities.

Ultimately, extreme appreciation is to the author family for their love, understanding, and encouragement during the author studies and thesis work.

CHAPTER V		
1	Subsequent melting endotherms (recorded at $10^{\circ}\text{C}\cdot\text{min}^{-1}$) for PTT samples isothermally crystallized from the melt state at different crystallization temperatures. Peaks I, II, and III denoted the low-, middle-, and high temperature melting endotherm, respectively	52
2	Wide-angle X-ray diffractograms of PTT samples isothermally crystallized from melt at the different crystallization temperatures	53
3	Subsequent melting endotherms (recorded at $20^{\circ}\text{C}\cdot\text{min}^{-1}$) for PTT samples after partial crystallization at (T_c) 182°C for different time intervals as indicated	54
4	Subsequent melting endotherms (recorded at $20^{\circ}\text{C}\cdot\text{min}^{-1}$) for PTT samples after partial crystallization at (T_c) 198°C for different time intervals as indicated	55
5	Subsequent melting endotherms (recorded at $20^{\circ}\text{C}\cdot\text{min}^{-1}$) for PTT samples after partial crystallization at (T_c) 208°C for different time intervals as indicated	56
6	Subsequent melting endotherms for PTT samples recorded using different heating rates ranging from 5 to $20\text{ C}\cdot\text{min}^{-1}$ after complete crystallization at 182°C	57
7	Subsequent melting endotherms for PTT samples recorded using different heating rates ranging from 5 to $20\text{ C}\cdot\text{min}^{-1}$ after complete crystallization at 198°C	58
8	Subsequent melting endotherms for PTT samples recorded using different heating rates ranging from 5 to $20\text{ C}\cdot\text{min}^{-1}$ after complete crystallization at 208°C	59

FIGURE	PAGE
9 Observed melting temperature of the primary crystallites as a function of crystallization temperature for PTT shown along with the linear Hoffman–Weeks extrapolation (solid line) and the non-linear Hoffman-Weeks extrapolation (dotted line, calculated using $\beta^m = 1.00$ and $a = 1.02$; dashed dot line, calculated using $\beta^m = 1.00$ and $a = 0.58$)	60
10 Plots of the scaled observed melting temperature [$M = T_m^\circ / (T_m^\circ - T_m)$] versus the scaled crystallization temperature [$X = T_m^\circ / (T_m^\circ - T_c)$] for various choices of the seeded equilibrium melting temperature (T_m°) for PTT (for the data collected over the T_c range of 188 to 208°C)	61
11 The variation of the thickening coefficient (β^m) as a function of the seeded equilibrium melting temperature (T_m°) for PTT (for the data collected over the T_c range of 188 to 208°C)	62

CHAPTER VI

1 Subsequent isothermal crystallization exotherm for neat PTT samples isothermally crystallized at 200°C after being melted at each respective melt-annealing temperature T_f for 5 min	84
2 Subsequent isothermal crystallization exotherm for sheared PTT samples (at 92.1 s ⁻¹) isothermally crystallized at 200°C after being melted at each respective melt-annealing temperature T_f for 5 min	85
3 Subsequent isothermal crystallization exotherm for sheared PTT samples (at 245.6 s ⁻¹) samples isothermally crystallized at 200°C after being melted at each respective melt-annealing temperature T_f for 5 min	86

FIGURE	PAGE	
4	Typical relative crystallinity function of time $\theta(t)$ for neat PTT samples isothermally crystallized at 200°C after being melted at each respective melt-annealing temperature T_f for 5 min. The raw data, shown as various geometrical points, were fitted to the Avrami and Urbanovici–Segal macrokinetic models, with the best fits being shown as dashed and solid lines, respectively	87
5	Relative crystallinity function of time $\theta(t)$ for all of the neat and sheared samples studied, which were isothermally crystallized at 200°C after being melted at a melt-annealing temperature T_f of 270°C for 5 min	88
6	Variation of the crystallization half-time $t_{0.5}$ as a function of the melt-annealing temperature T_f for all of the neat and sheared PTT samples studied	89
7	Variation of the reciprocal value of the crystallization half-time $t_{0.5}^{-1}$ as a function of the melt-annealing temperature T_f for all of the neat and sheared PTT samples studied	90
8	Variation of the Avrami rate constant K_a as a function of the melt-annealing temperature T_f for all of the neat and sheared PTT samples studied	91
9	Variation of the Urbanovici–Segal rate constant K_{us} as a function of the melt-annealing temperature T_f for all of the neat and sheared PTT samples studied	92
10	WAXD patterns of neat PTT samples isothermally crystallized at 200°C after being melted at each respective fusion temperature T_f for 5 min.	93
11	Subsequent melting thermogram (20°C·min ⁻¹) for neat PTT samples isothermally crystallized at 200°C after being melted at each respective melt-annealing temperature T_f for 5 min	94

FIGURE	PAGE
12 Subsequent melting thermogram ($20^{\circ}\text{C}\cdot\text{min}^{-1}$) for sheared PTT samples (at 92.1 s^{-1}) isothermally crystallized at 200°C after being melted at each respective melt-annealing temperature T_f for 5 min	95
13 Subsequent melting thermogram ($20^{\circ}\text{C}\cdot\text{min}^{-1}$) for sheared PTT samples (at 245.6 s^{-1}) isothermally crystallized at 200°C after being melted at each respective melt-annealing temperature T_f for 5 min	96

CHAPTER VII

1 Non-isothermal cold crystallization exotherm of PTT without shear effect and relative crystallinity recorded at a heating rate of $20^{\circ}\text{C}\cdot\text{min}^{-1}$	128
2 Non-isothermal cold crystallization exotherms of PTT shear untreated and shear treated samples at 5 and 10 s^{-1} at three different shearing time. Crystallization exotherm of the second heating scan of PTT at shear rate 5 s^{-1} at shearing time for 1 min are also shown (recorded at a heating rate of $20^{\circ}\text{C}\cdot\text{min}^{-1}$)	129
3 Non-isothermal cold crystallization exotherms of PTT shear untreated and shear treated samples at low shear rates for fixed shearing time 1 min and at high shear rate. Crystallization exotherm of the second heating scan of PTT at shear rate 92.1 s^{-1} are also shown (recorded at a heating rate of $20^{\circ}\text{C}\cdot\text{min}^{-1}$)	130
4 Plot of peak temperature of cold crystallization of PTT non-sheared and sheared samples at a heating rate of $20^{\circ}\text{C}\cdot\text{min}^{-1}$	131
5 Relative crystallization function of temperature of PTT non-sheared and sheared sample at different shear rate at a
