## APPENDIX A

### The Climate of Southeast Asia

Southeast Asia is located between 10°S to about 20°N latitude and between 94°E to 145°E longitude. It is bordered by the Australian continent in the south and the Eurasian continent in the north, while the east and west is bordered by the Pacific and Indian Oceans. The climate in Southeast Asia is hot and humid conditioned by its geographic position and by local topographic difference. The climate varies from extremely dry zone (500 mm/yr) to extremely wet zone (7,000 mm/yr). The climate of Southeast Asia is controlled by a very large extent of Asian monsoon system (Northeast monsoon and Southwest monsoon). In Southeast Asia, the climate changes significantly from month-to-month due to air circulation over this part of the world. In the equatorial ( $\pm 30^\circ$ ) region, earth surface absorbs more heat by solar radiation. Unequal surface heating creates air streams in the atmosphere in a particular (zonal) direction. Due to the earth's rotation, these air streams do not have a constant speed and direction. Near the earth's surface, air streams deviate from zonal direction due to the obstacle by mountain chains and the influence of ocean streams.

In the equator, air pressure is low and water evaporates from the ocean, river and forests. The ascending air with high moisture content is unstable. When the ascending air cools off, the heavy clouds are formed until it reaches the saturation point, then heavy rain and thunderstorms occur. After that energy is released and the air will ascend to attitude over 10 km.

In the low-pressure zone due to the highest heat of the earth-surface, air streams convene in to this low-pressure zone. This zone is called the Intertropical Convergence Zone (ITCZ) or sometimes called equatorial trough, monsoon trough. Weather condition in this zone includes widespread cloudiness, convective rains and precipitation. The ITCZ zone moves from the northern direction to the southern direction and vice versa corresponding to the sun-track movement. This ITCZ movement plays significant roles to the rainfall pattern over Southeast Asia and causes seasonal variation. The season in Southeast Asia can be classified as two or three seasons (hot or dry season, rainy season and cold season.) In Low latitude ( $\pm 50^\circ$ ) closed to the equator, only two seasons exist (rainy and dry season) in Malaysia, Singapore, Indonesia while above latitude  $\pm 10^\circ$  (Thailand, The Philippines, Vietnam) has three seasons.

During the northern hemisphere winter, high pressure areas develop over Siberia. This high pressure area is caused by intense cooling of the earth's atmosphere. But, in the southern hemisphere summer, low pressure area develops over Australia due to the hot earth surface. The consequence of the effects of different pressure over Southeast Asia causes several effects as follows:

- 1) The north wind from Siberia brings relatively cool and dry air over Thailand and Indo-china and the northeastern coast of Sumatra. Rainfalls are rarely found during this period.
- 2) The northeast wind from the north Pacific Ocean brings moderately warm up and humid toward the east coast of the Philippines and pass the South China Sea and direct toward to Malaysia. This wind brings more moisture causing heavy rainfall along the east coast of Thailand Peninsular and Malaysia Peninsular.
- 3) The northwest wind across the equator changes direction due to the earth's rotation. This wind brings humid air towards the northern coast of Java and intensifies the rainfall particularly in west-Java due to the East-West chain of volcanoes.

During the northern hemisphere summer, the Eurasian continent is heated up much more intensively than the tropical region causing a consequence air streams from different direction reaching the Southeast Asia region. The consequence of air streams brings several influences:

- 1) Southeast winds from the Australian continent are cool and relatively dry and effect the climate of particularly the southern part of Indonesia,
- 2) Southwest monsoon wind affects the eastern cost of Sumatra, Malaysia, Thailand Peninsular and Indo-China. Rainfall due to Southwest monsoon is relatively high in those regions,
- 3) Southwest wind brings humid air from the Indian Ocean towards Sumatra north-coast, Malaysia Peninsular and Thailand west-cost Peninsular and major paths of Thailand and Indo-china,
- 4) East-Northeast streams arrive from the North-Pacific. The easterly waves may cause into cyclonic disturbances and reach the Philippines in various stages of development, from tropical depression to tropical typhoons during July to October and brings heavy rainfall in north Mindanao, the Philippines, Vietnam, Laos, and the north-eastern part of Thailand.

It is clearly indicated that air streams and locally wind change the direction and strength month by month. This behavior influences the rainfall distribution and also varies from month-to-month. Therefore the monthly rainfall map for the entire region can be composed from various sources that shall be explained in the following.

In January, the ITCZ is located in the south of Indonesia and the air streams from the northern hemisphere winter prevail from the north to south direction. It causes extremely dryness in

the major parts of north and center of Thailand and the west-coast of the Malaysian Peninsula. However, most parts of Indonesia are wet and have high precipitation. And, the east coast of the Philippines islands are relatively wet due to easterly winds from the Pacific Ocean.

In February, the Northeast monsoon becomes weaker. The ITCZ is still located around Australia. All regions located in the north of the equator become drier except the Luzon's east coast of the Philippines which is still wet. Thailand and Malaysia Peninsular influences of dry wind from the north and the Sumatra's east coast are relatively dry.

In March, the ITCZ is just located at the south of Java. As the sun moved towards the north, the north winds over Thailand are much weaker and increasing temperature on the mainland. When the ITCZ approach Sumatra, heavy rainfall occurs over the path of Sumatra and Java.

In April, the ITCZ moves further north and locates over Sumatra and Kalimantan islands. As a result, winds start to change direction. Southeast Indonesia becomes drier and the east of Java and the north of Java have less rainfall than in March. The southwest coast of Malaysia and the southwest cost of Thailand Peninsular become wet and have high rainfall. The mainland of Thailand becomes more humid.

In May, the ITCZ moves rapidly to the north of Indo-China and the climate change is considerable. The east coast of Kalimantan is relatively dry. At the north of the equator, the wind changes direction and becomes southwesterly. Therefore, this leads to the increasing rainfall along the northwest coast of Thailand Peninsular and the northwest coast of Malaysia. Increasing rainfall over Thailand compared to April appears in the western area of the mountain ranges. Most of the Midanao island of the Philippines become wet.

In June, the ITCZ moves to the northern of Indo-China. The southeasterly winds have gained in strength an influence to the most part of Java, south of Sumatra and Malaysia peninsular. The peninsular of Thailand obtains heavy rainfall along the west coast, but it is relatively dry on the reward side of the mountains. The southwest monsoon also influence the climate of Thailand, the Philippines.

In July and August, the southeast monsoon develops strength causing more rainfall in Thailand, Malaysia and some moderate rain in Sumatra. The southeast air streams at the south of the equator have become more intense causing dry weather over Java, South and Southeast of Sulawesi and Kalimantan which are relatively dry. Typhoons are also developed and affect the northern part of Luzon.

In September, the southwest monsoon is at a maximum strength in Southeast Asia. Some parts of north Sumatra, north Malaysia, Thailand, Kalimantan, Sarawak and the entire Philippines have heavy rainfall. The typhoon track is over the Luzon and the Vietnam. At the same time the southeast air stream has maximum strength on the south of equator.

In October, the ITCZ makes toward the central of Thailand to the south. The north latitude above 10°N becomes cold and dry. Rainfall occurs in the low latitude above Malaysia and Indonesia. The typhoon track tends to move to the southwest. The southeast wind brings dry air towards the southeast of Indonesia

In November, the ITCZ moves towards a position around 5°N. The central-northern part of Thailand becomes significantly drier. But the east cost of the Philippines is significantly wetter while the east-coast of Malaysia and Thailand peninsular become wetter, and the entire Java, Kalimantan and Sulawesia become wetter.

In December, the ITCZ is located between the equator and the South of equator (0-8°S) The coastal areas of Java are extremely dry due to orographic lifting and cause extremely heavy rainfall on both northern and southern sides. All paths of Thailand except the peninsula are extremely dry and cold. The extremely rainfall occurs on the east-coast of Thailand and Malaysia Peninsulars.

## APPENDIX B

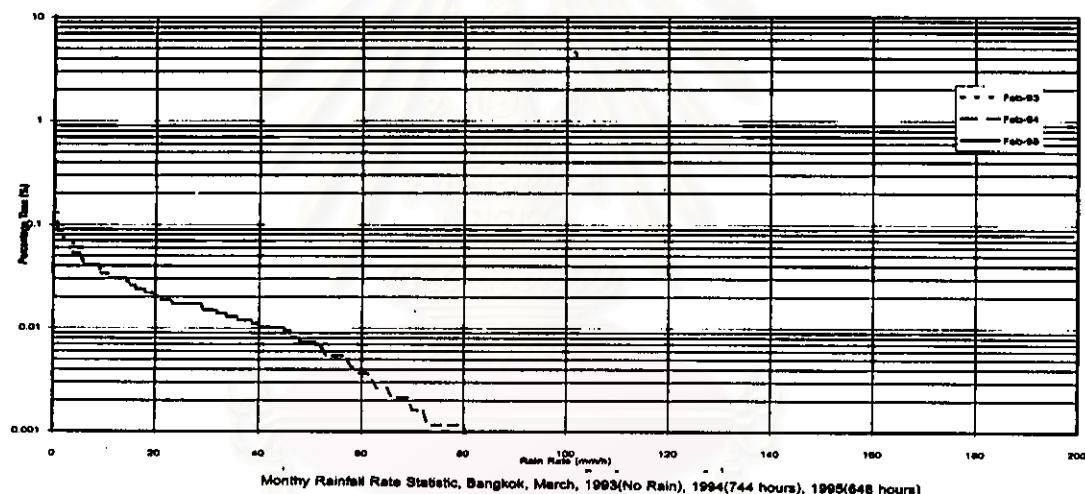

### RAINFALL MEASUREMENT RESULTS

#### 1. Monthly Cumulative Rain Intensity Distributions, 1/Mar/92 - 28/Feb/95, N. Yoothanorm [1997]

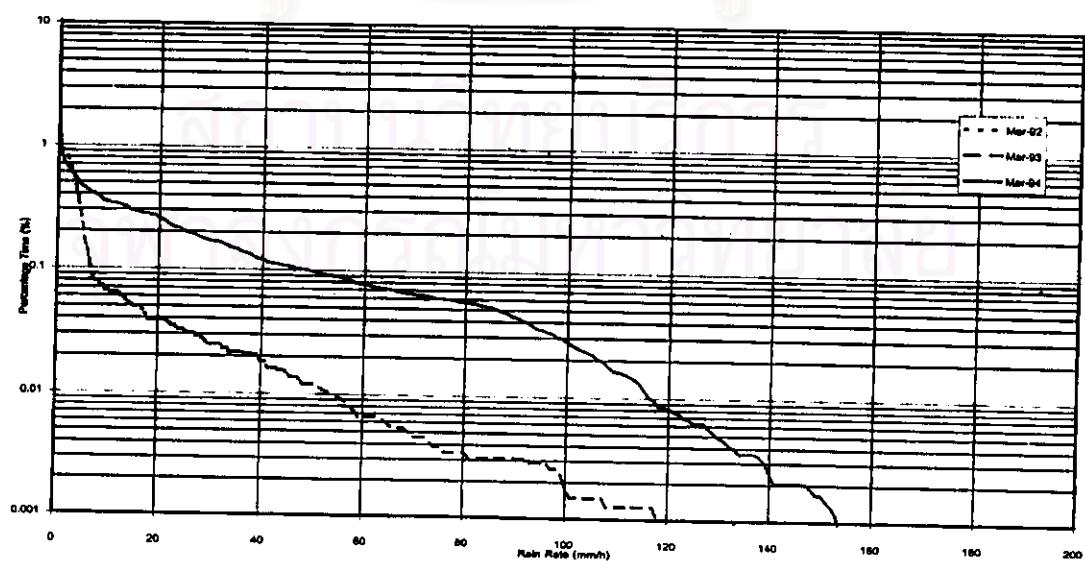

Monthly Rainfall Rate Statistic, Bangkok, January, 1993(676 hours), 1994(No Rain), 1995(720 hours)

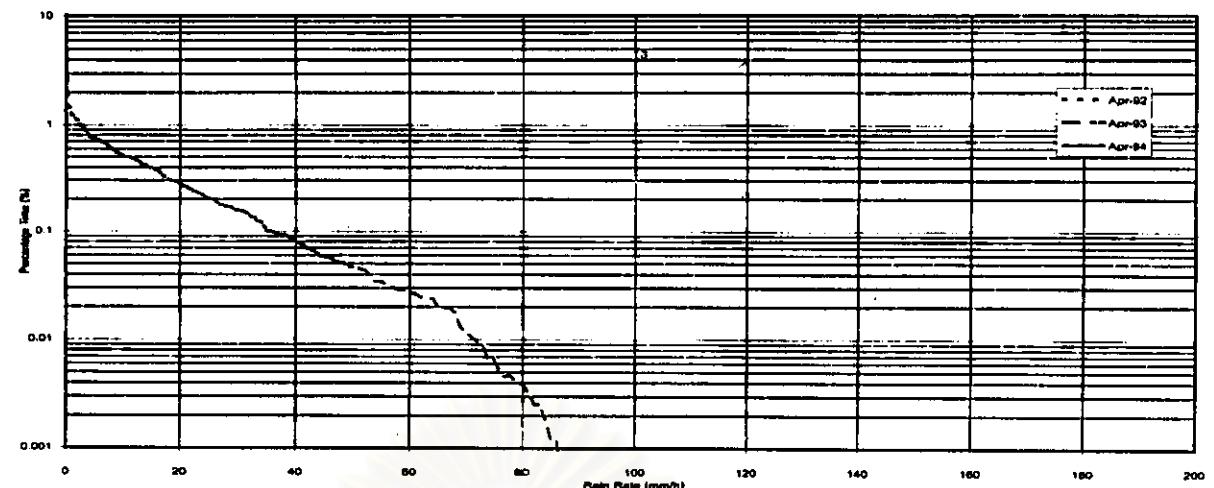

Monthly Rainfall Rate Statistic, Bangkok, February, 1993(No Rain), 1994(600 hours), 1995(No Rain)

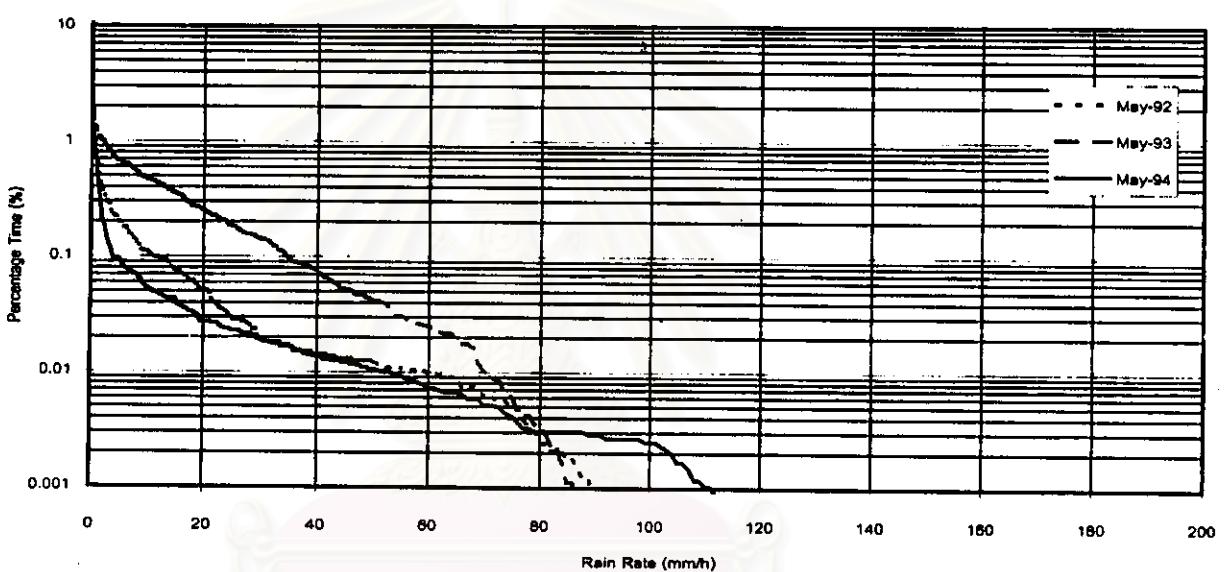

Monthly Rainfall Rate Statistic, Bangkok, March, 1993(No Rain), 1994(744 hours), 1995(648 hours)

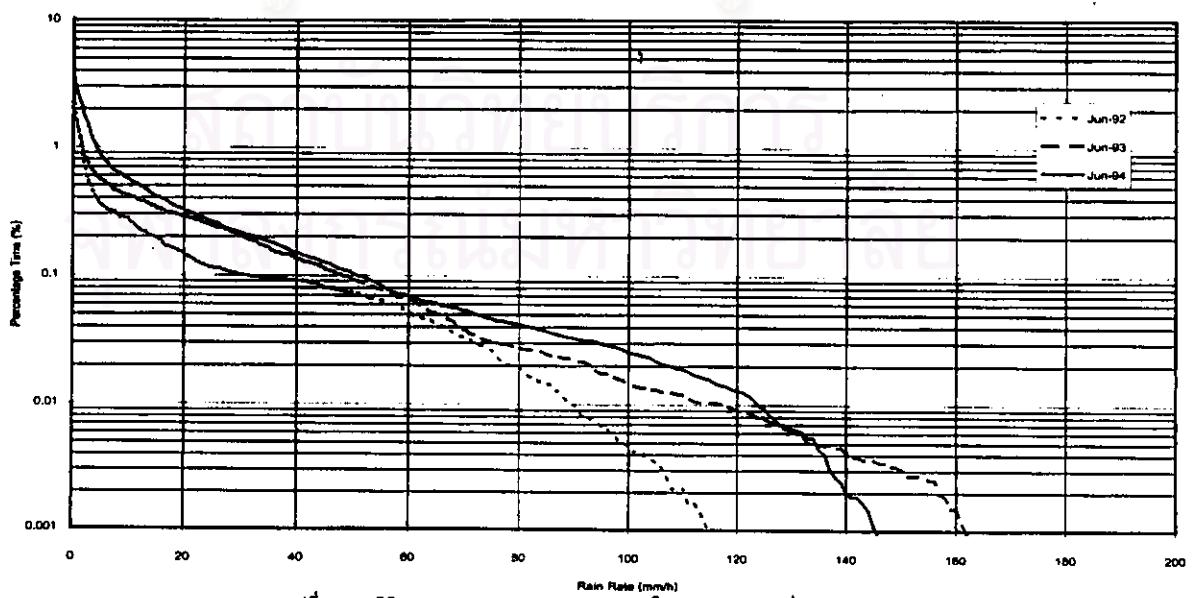

Monthly Rainfall Rate Statistic, Bangkok, April, 1992(No Rain), 1993(380 hours), 1994(No Data)

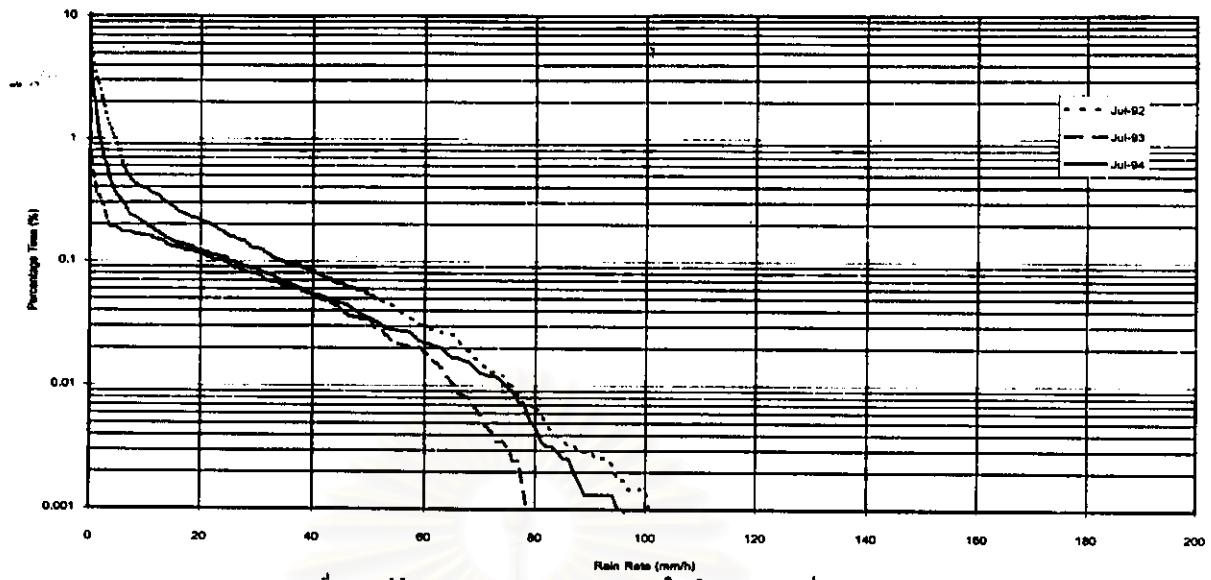

Monthly Rainfall Rate Statistic, Bangkok, May, 1992(744 hours), 1993(672 hours), 1995(432 hours)

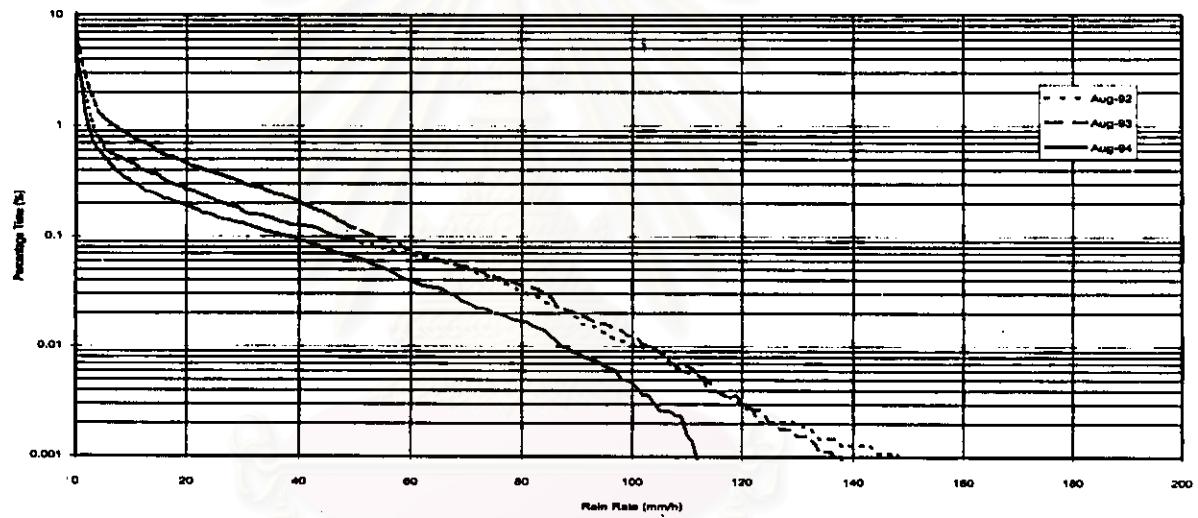

Monthly Rainfall Rate Statistic, Bangkok, June, 1992(720 hours), 1993(720 hours), 1995(528 hours)

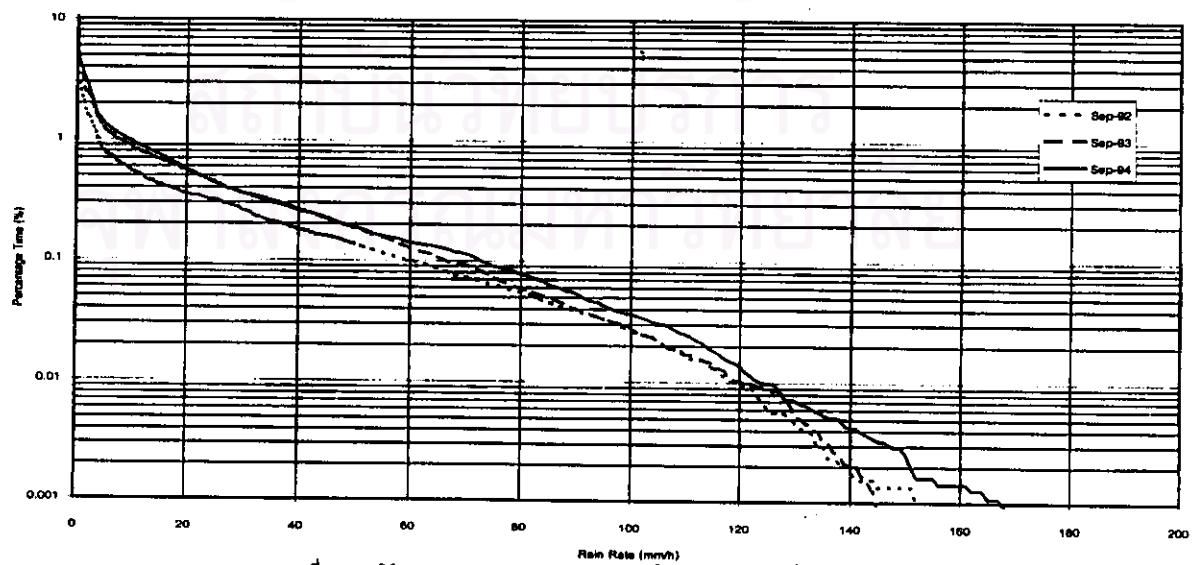

Monthly Rainfall Rate Statistic, Bangkok, July, 1992(720 hours), 1993(720 hours), 1995(552 hours)

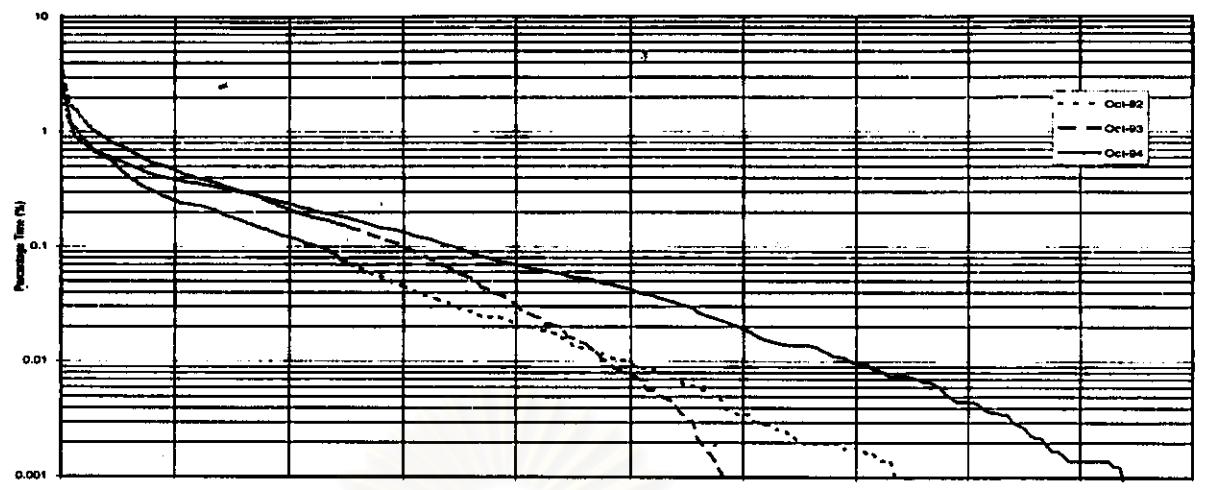

Monthly Rainfall Rate Statistic, Bangkok, August, 1992(720 hours), 1993(720 hours), 1995(744 hours)

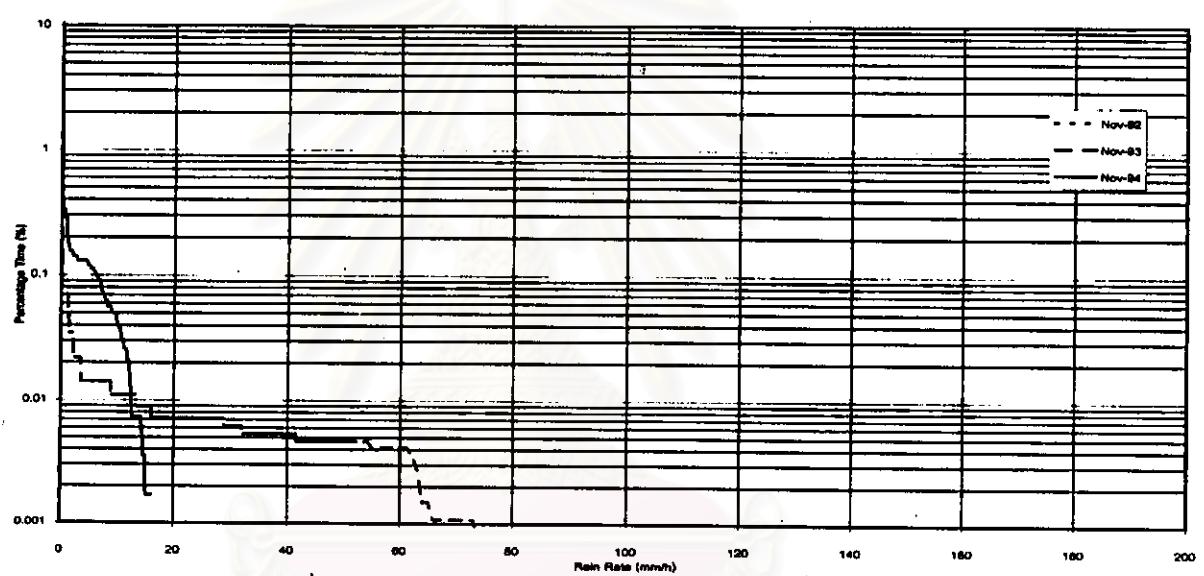

Monthly Rainfall Rate Statistic, Bangkok, September, 1992(720 hours), 1993(642 hours), 1995(720 hours)

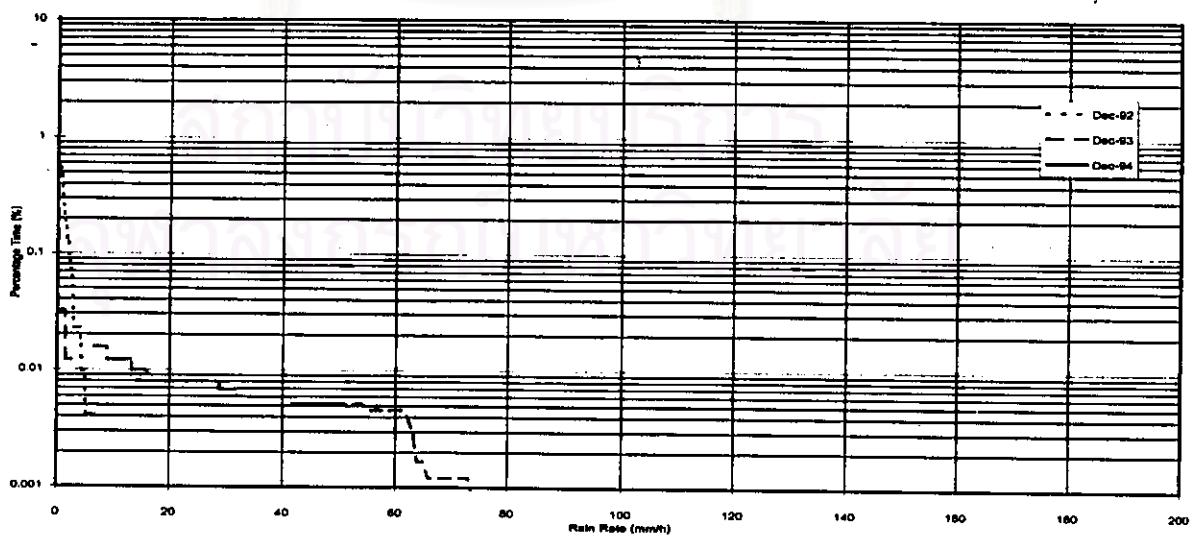

Monthly Rainfall Rate Statistic, Bangkok, October, 1992(360 hours), 1993(720 hours), 1995(720 hours)

Monthly Rainfall Rate Statistic, Bangkok, November, 1992(No Rainfall), 1993(720 hours), 1995(720 hours)

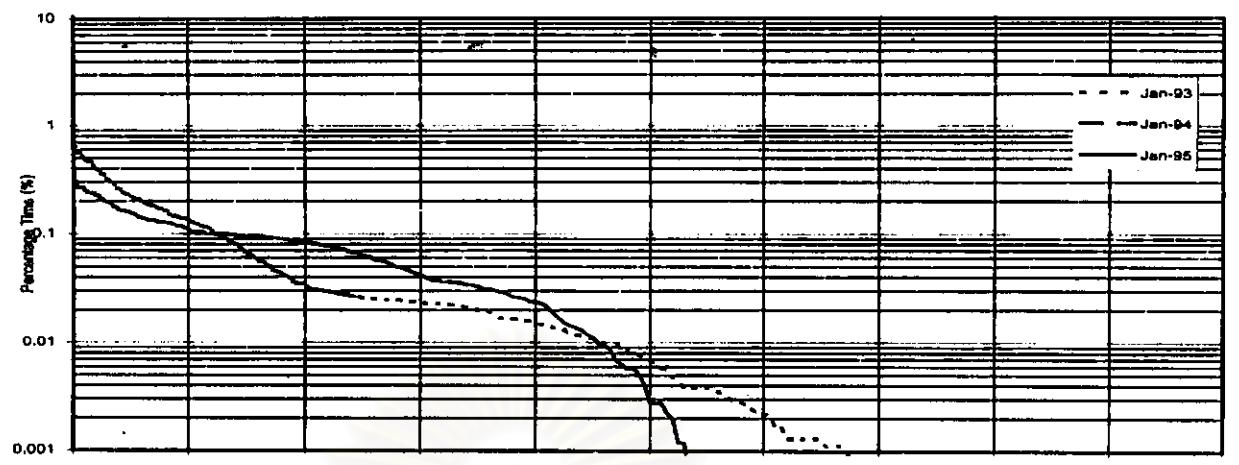

Monthly Rainfall Rate Statistic, Bangkok, December, 1992(720 hours), 1993(648 hours), 1995(No data)

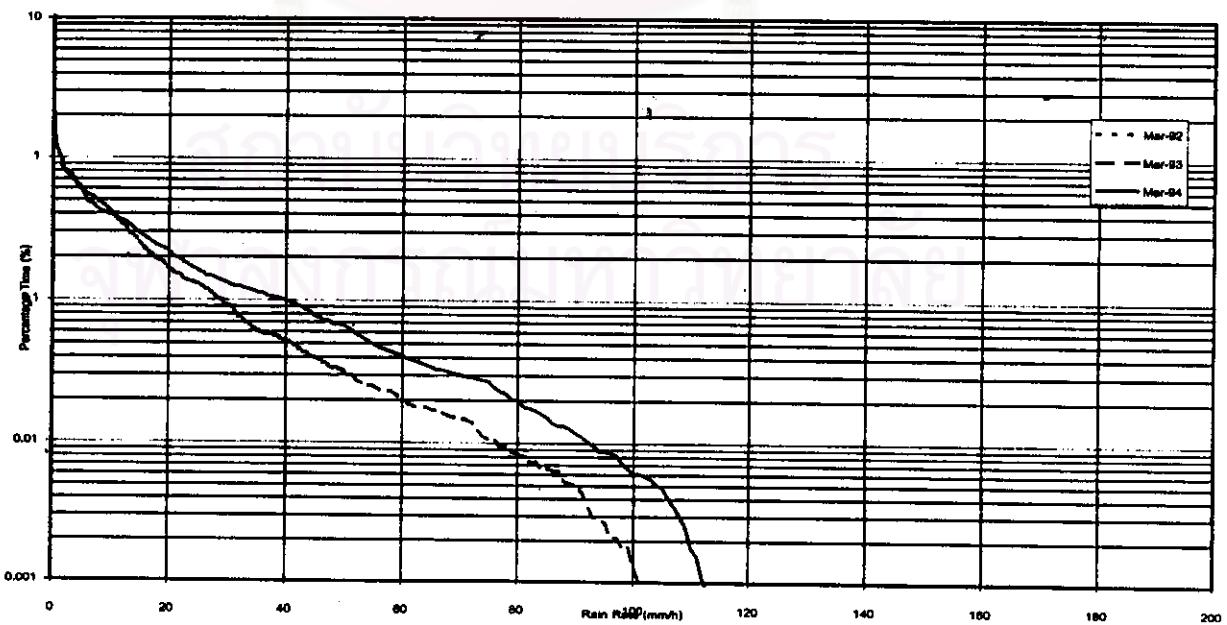

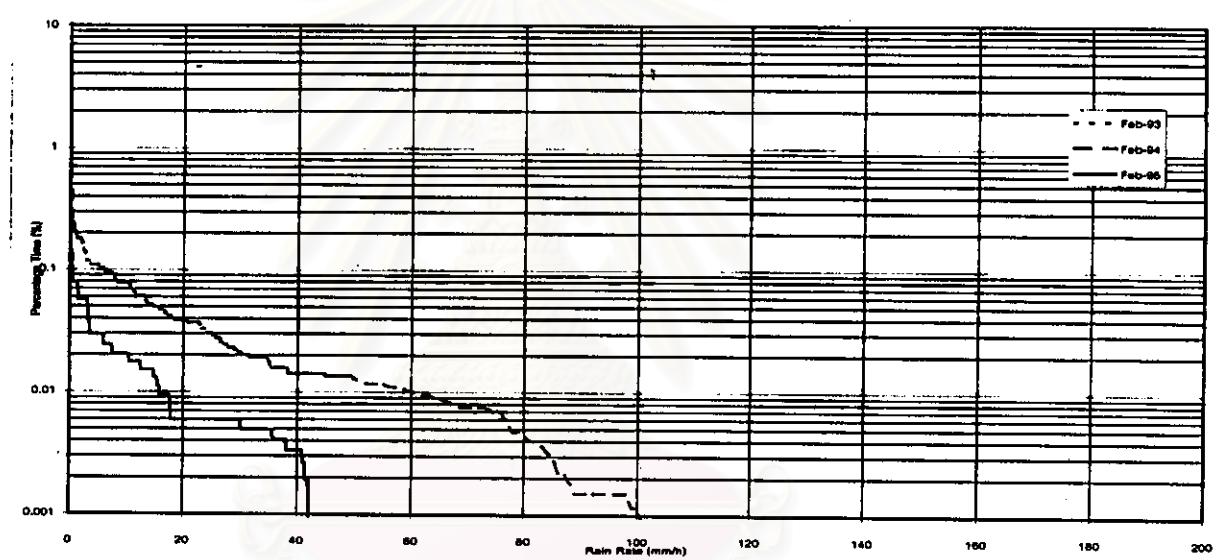

2. Si-Racha, 1/Mar./92 - 28/Feb/05, N. Yoothanorm, et . al., [1997]

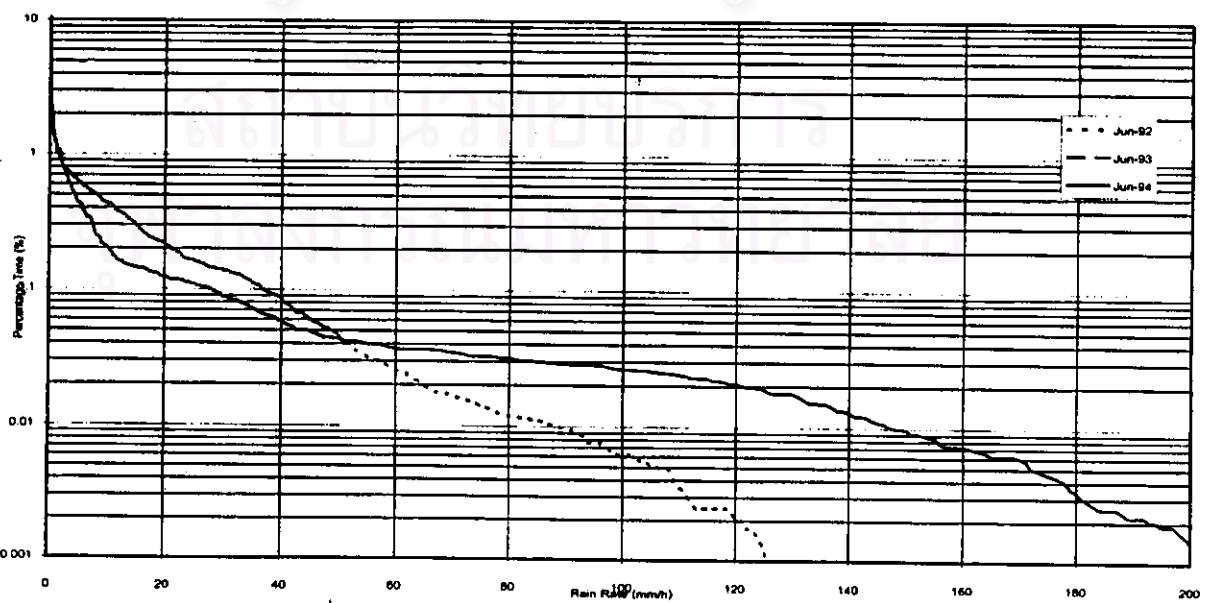

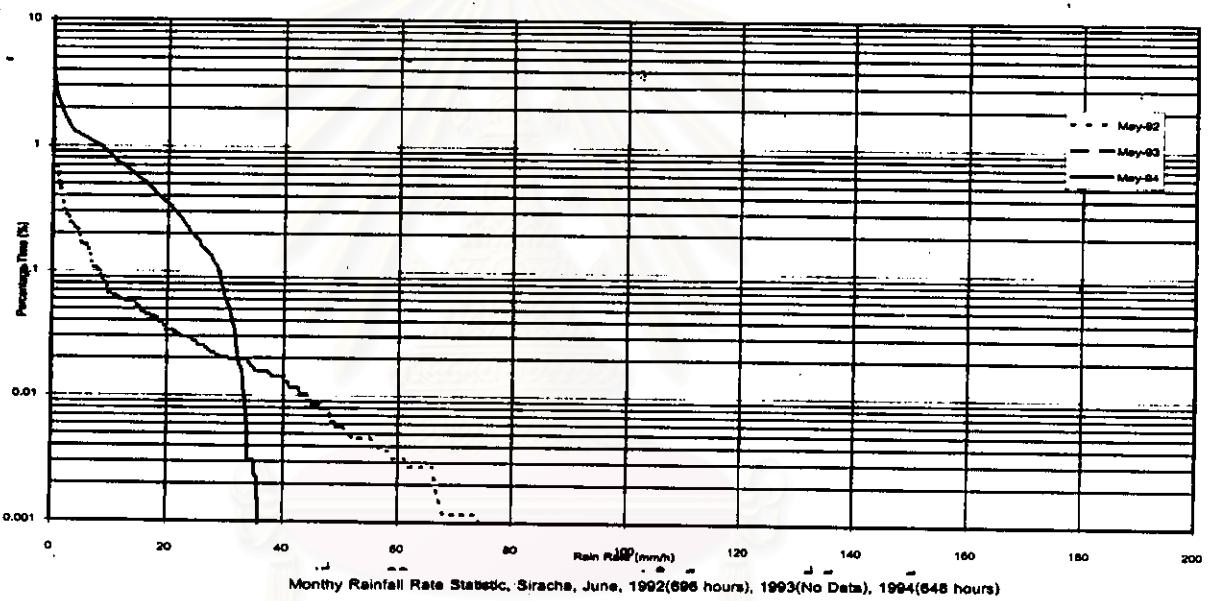

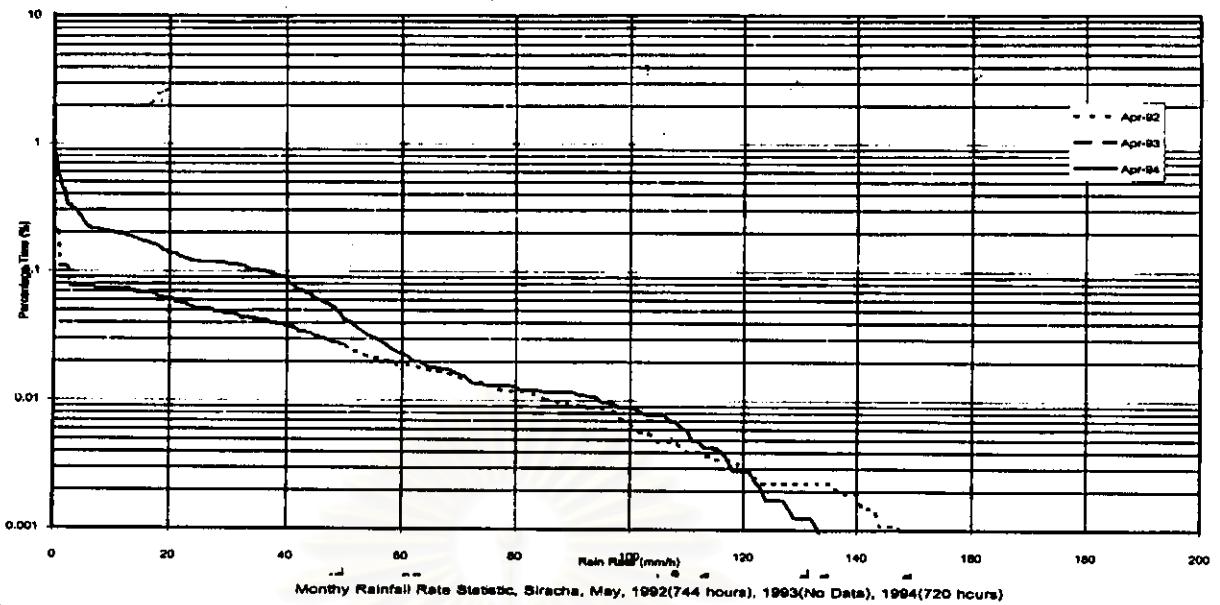

Monthly Rainfall Rate Statistic, Siracha, 1993(744 hours), 1994(No Rainfall), 1995(696 hours)

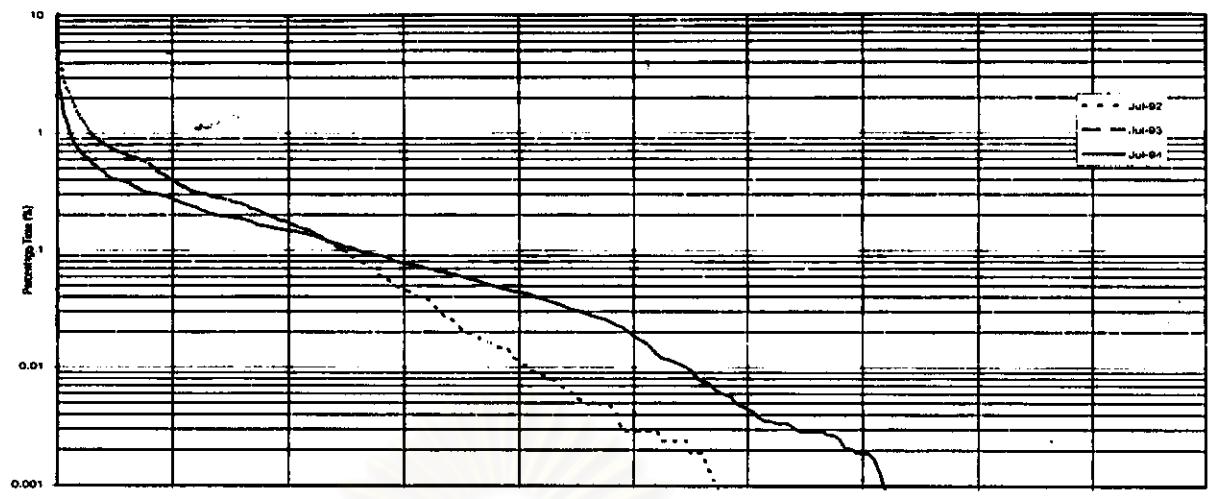

Monthly Rainfall Rate Statistic, Siracha, 1993(No Rainfall), 1994(848 hours), 1995(672 hours)

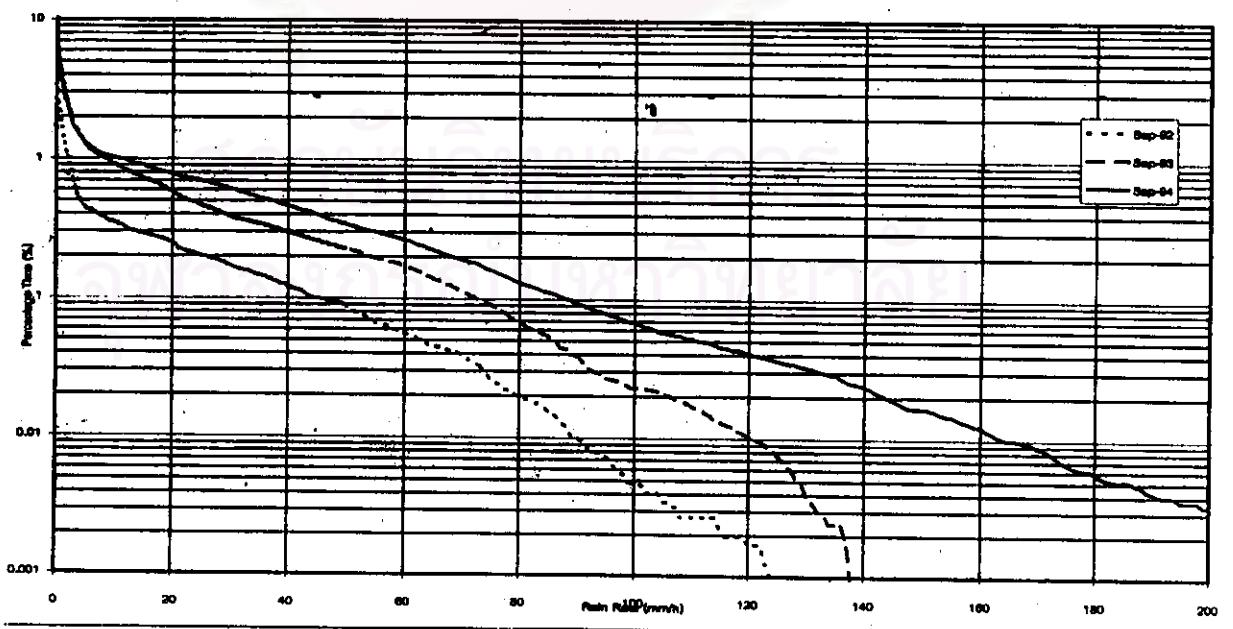

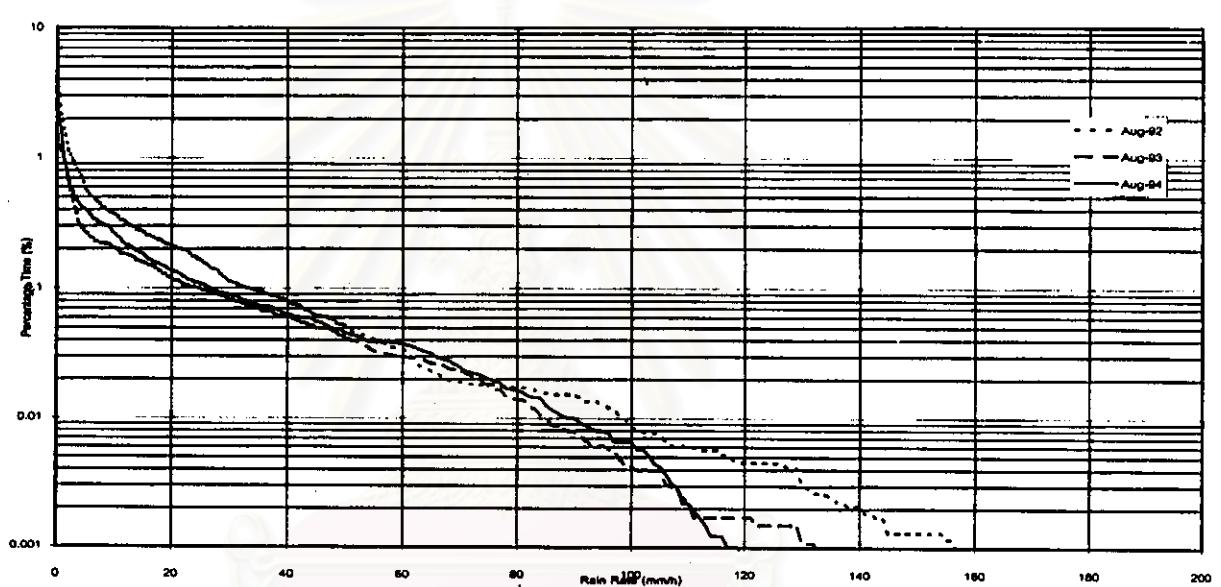

Monthly Rainfall Rate Statistic, Siracha, 1992(696 hours), 1993(No Rainfall), 1994(696 hours)

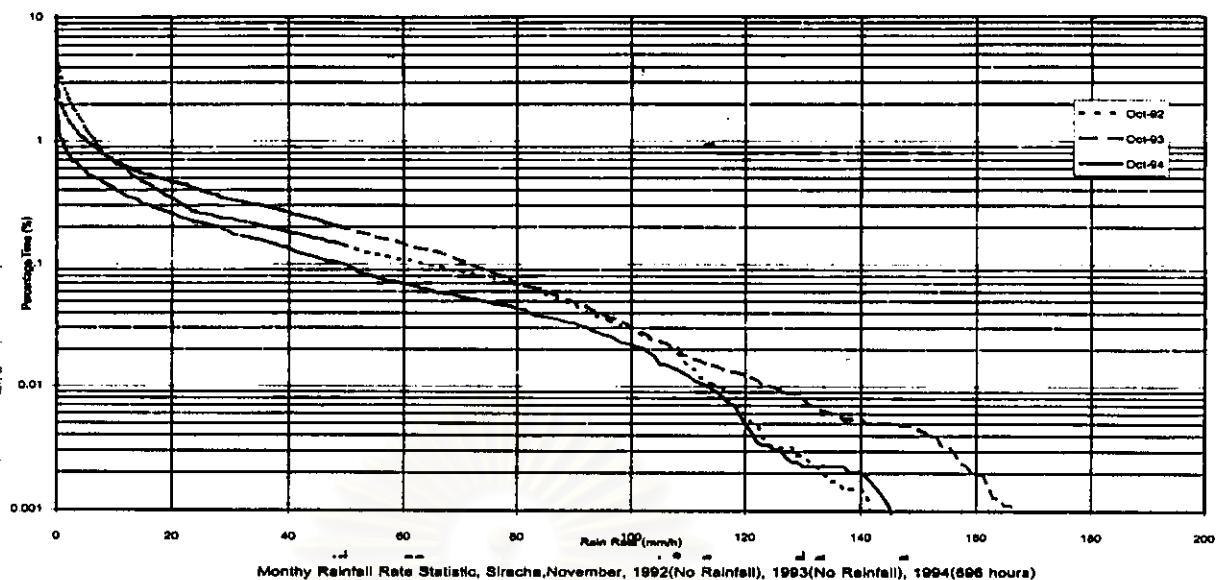

Monthly Rainfall Rate Statistic, Siracha, July, 1992(720 hours), 1993(No Data), 1994(720 hours)

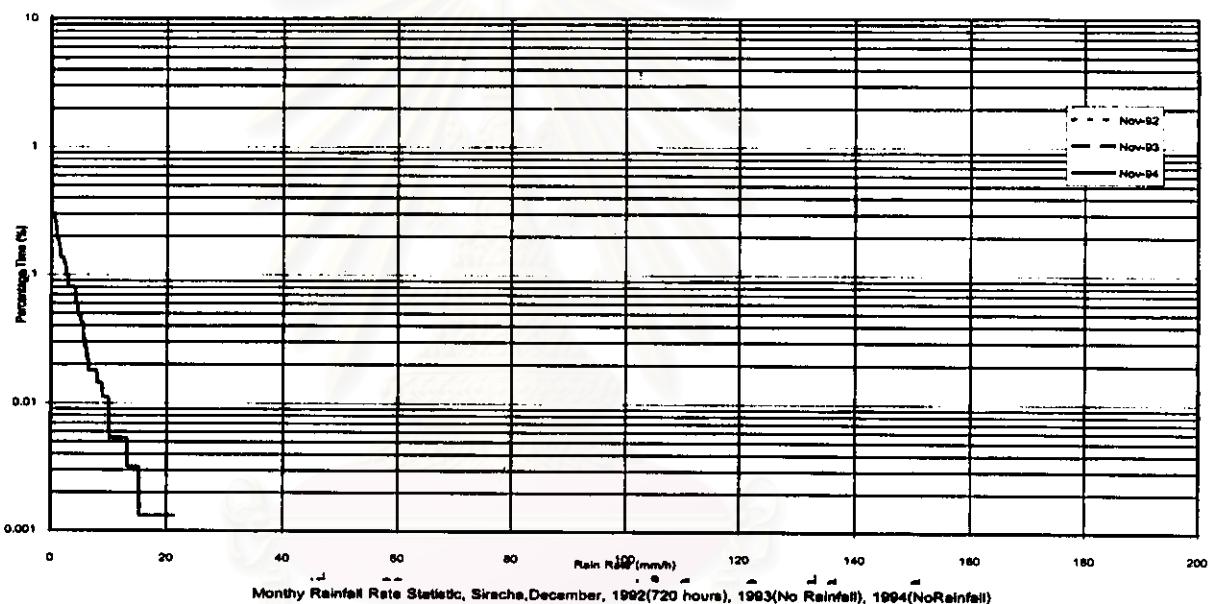

Monthly Rainfall Rate Statistic, Siracha, August, 1992(744 hours), 1993(720 hours), 1994(672 hours)

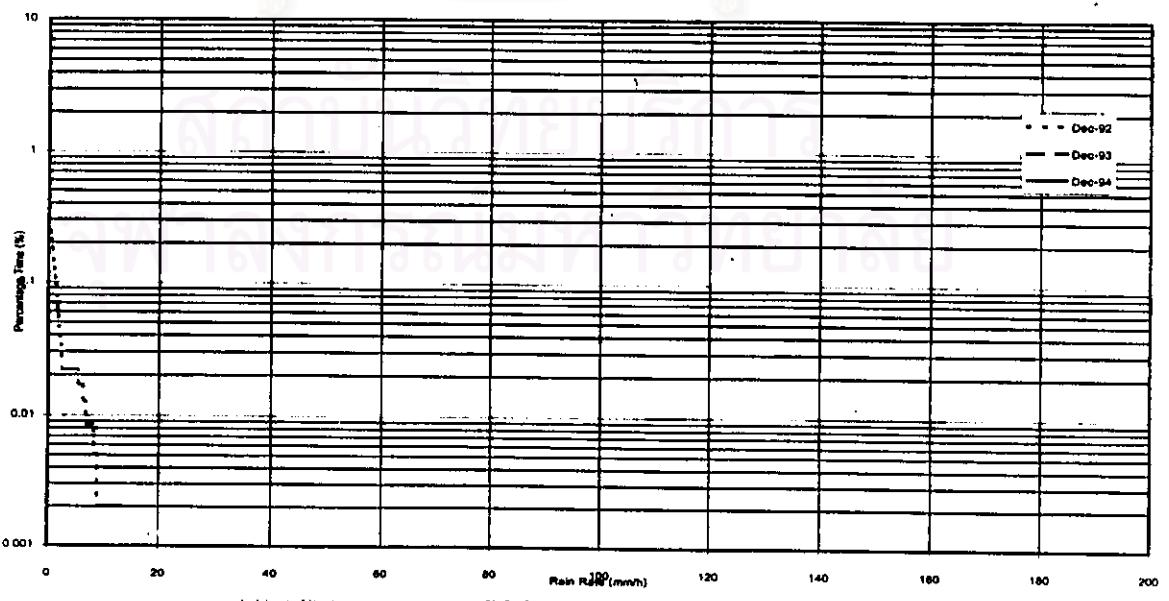

Monthly Rainfall Rate Statistic, Sirecha, October, 1992(720 hours), 1993(720 hours), 1994(720 hours)

Monthly Rainfall Rate Statistic, Sirecha, November, 1992(No Rainfall), 1993(No Rainfall), 1994(596 hours)

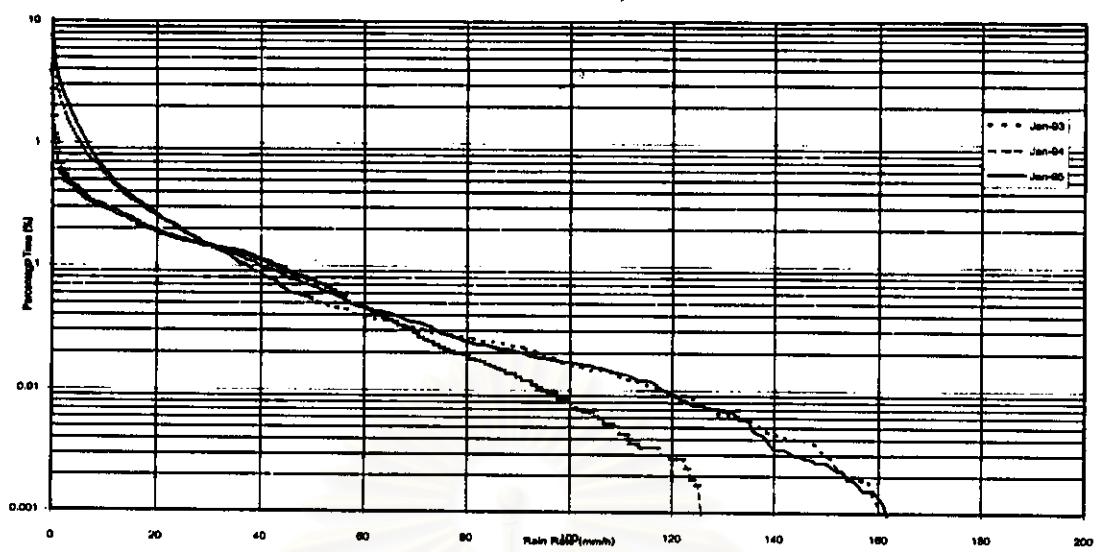

Monthly Rainfall Rate Statistic, Sirecha, December, 1992(720 hours), 1993(No Rainfall), 1994(No Rainfall)

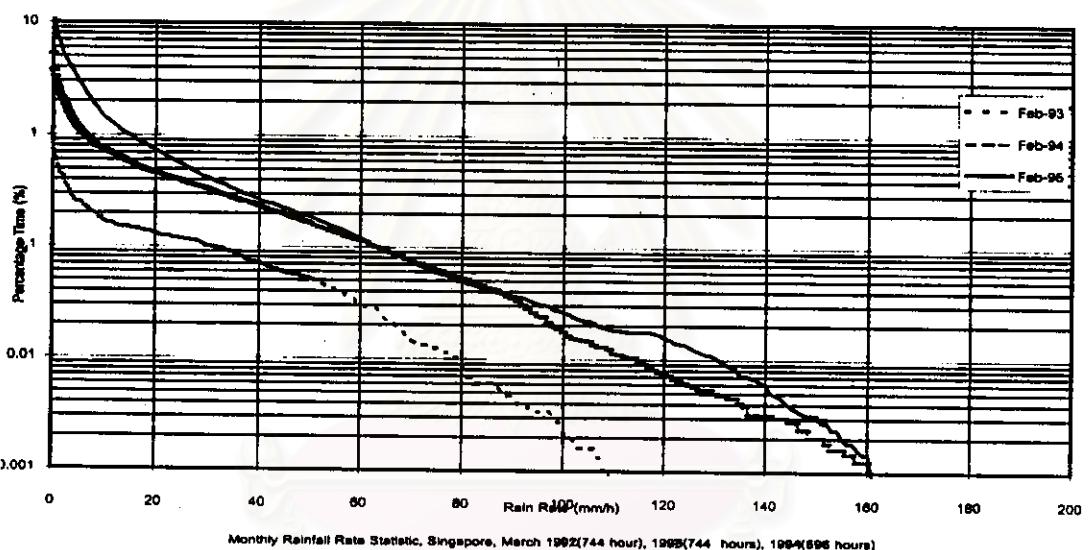

### 3. Singapore, Monthly Cumulative Distribution, 1/Mar/92 - 28/Feb/95

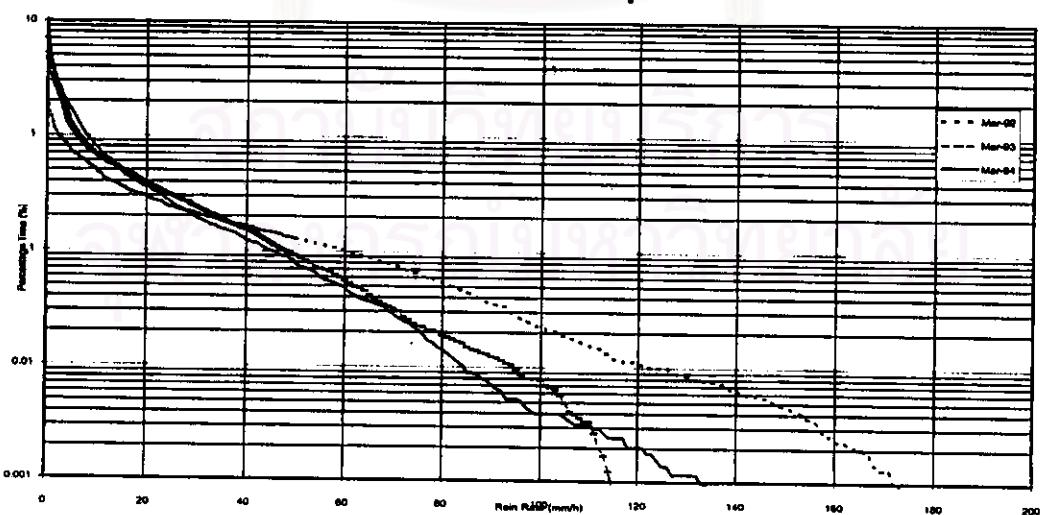

Monthly Rainfall Rate Statistic, Singapore, 1993(744 hour), 1994(744 hours), 1995(744 hours)

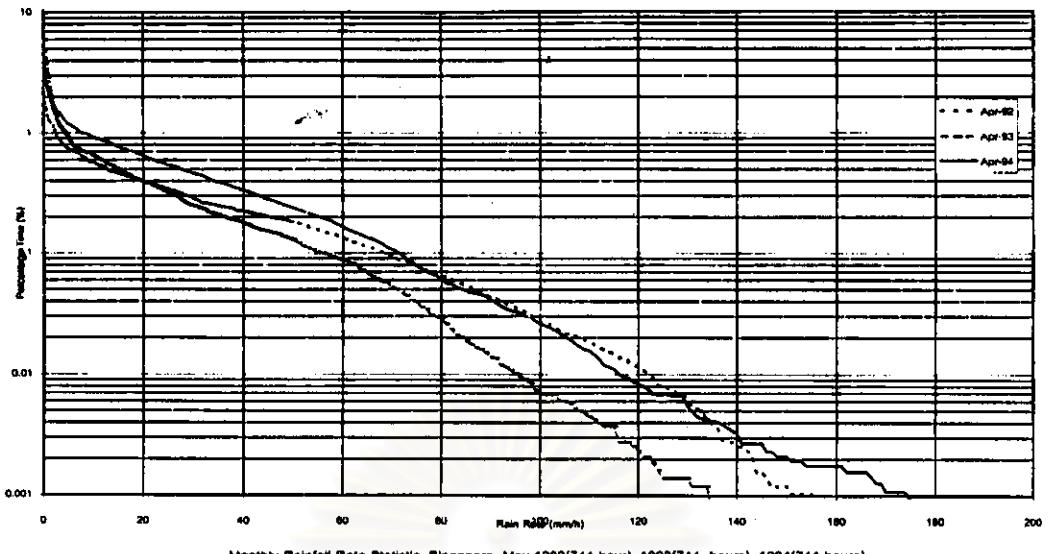

Monthly Rainfall Rate Statistic, Singapore, February 1993(672 hour), 1994(672 hours), 1995(672 hours)

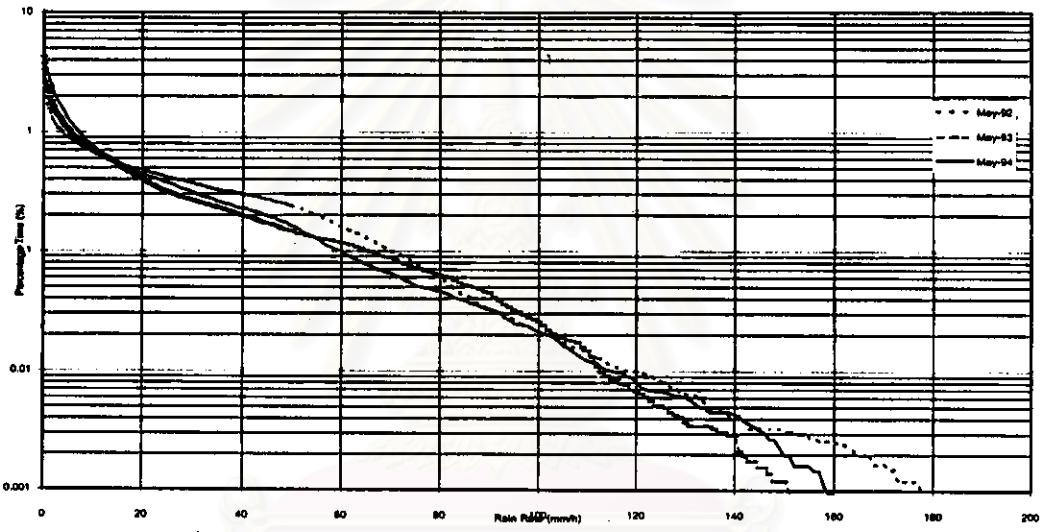

Monthly Rainfall Rate Statistic, Singapore, March 1993(744 hour), 1994(744 hours), 1995(696 hours)

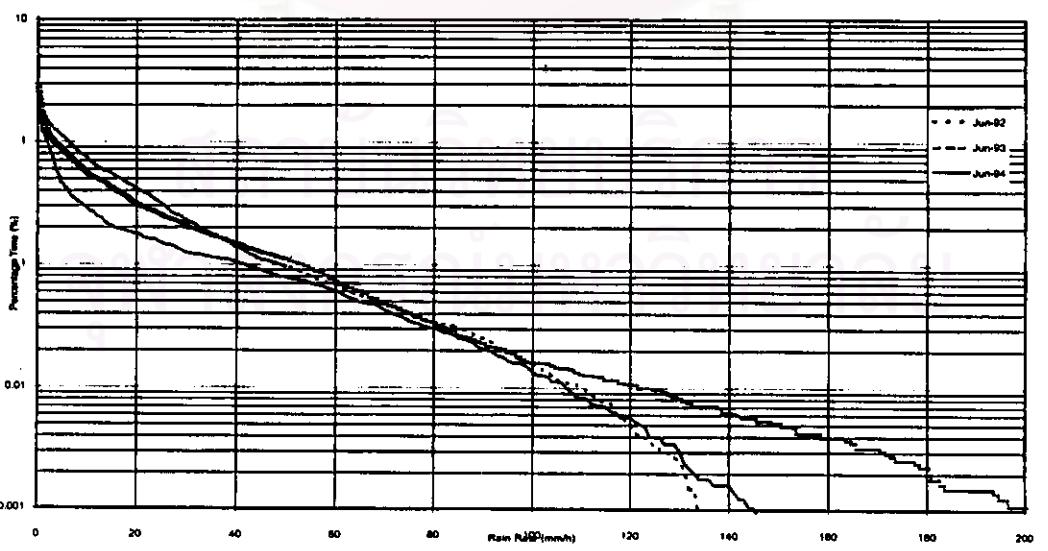

Monthly Rainfall Rate Statistic, Singapore, April 1992(720 hour), 1993(720 hours), 1994(596 hours)

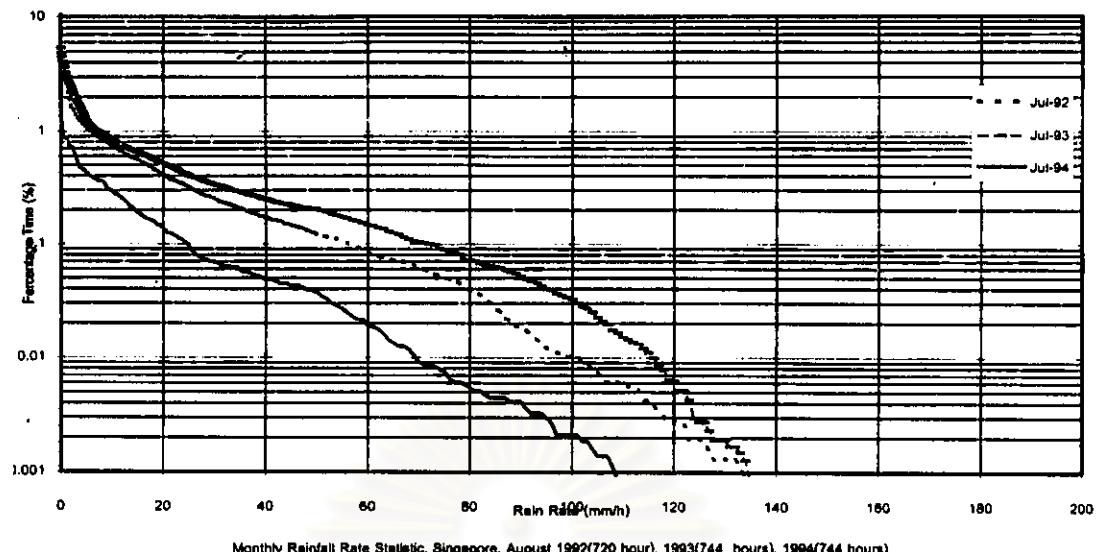

Monthly Rainfall Rate Statistic, Singapore, May 1992(744 hour), 1993(744 hours), 1994(744 hours)

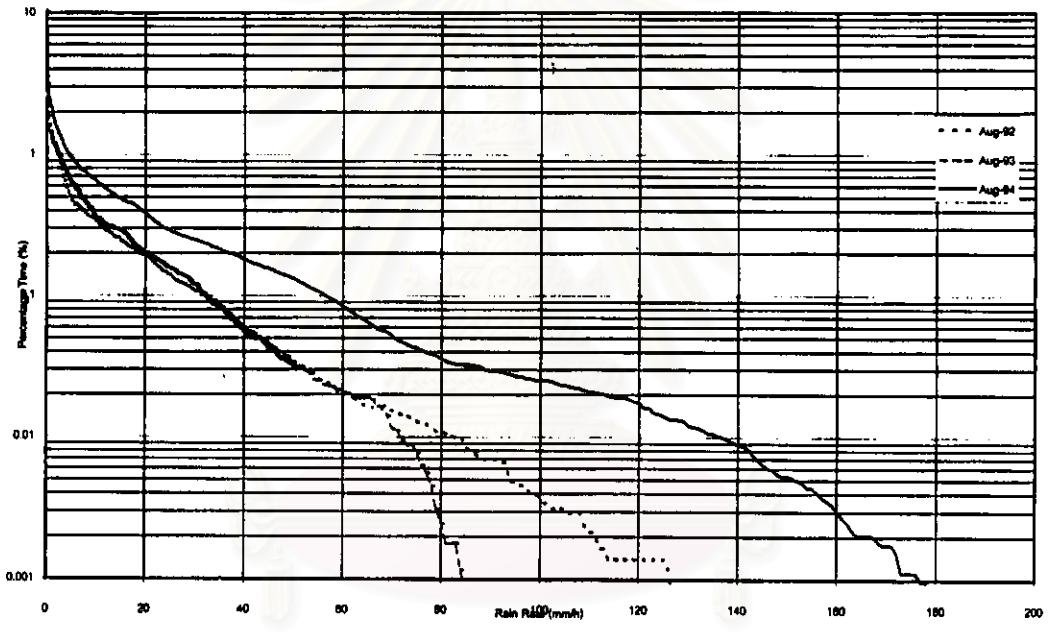

Monthly Rainfall Rate Statistic, Singapore, June 1992(720 hour), 1993(720 hours), 1994(504 hours)

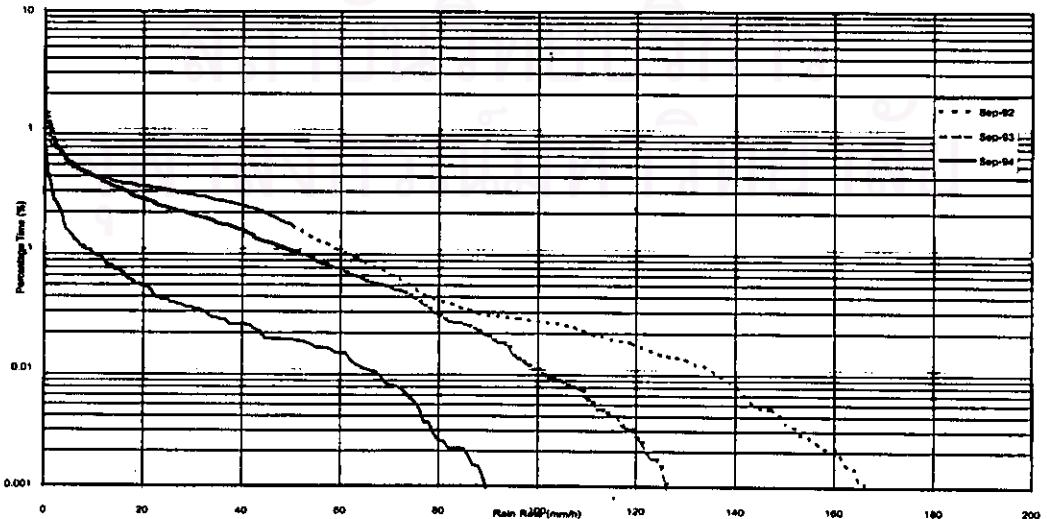

Monthly Rainfall Rate Statistic, Singapore, July 1992(744 hour), 1993(744 hours), 1994(744 hours)

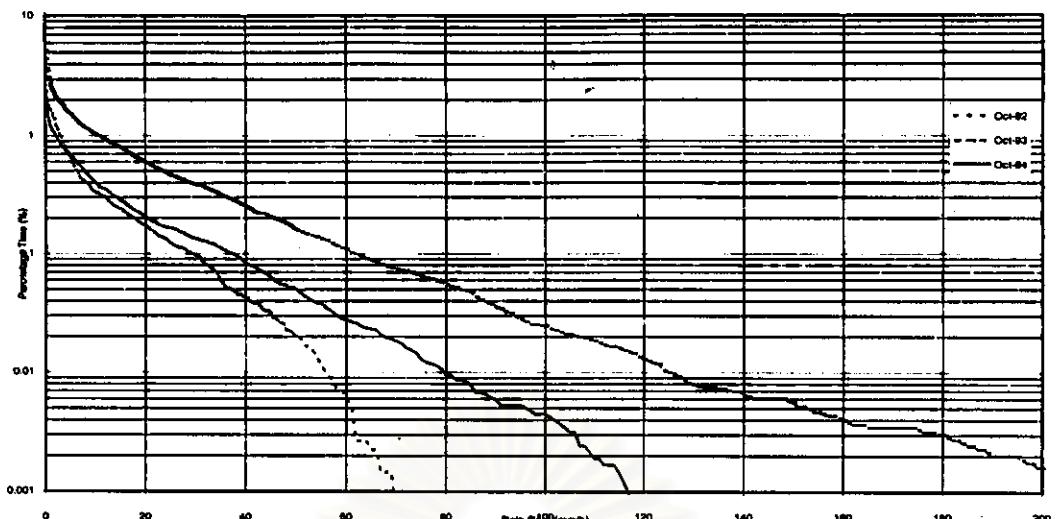

Monthly Rainfall Rate Statistic, Singapore, August 1992(720 hour), 1993(744 hours), 1994(744 hours)

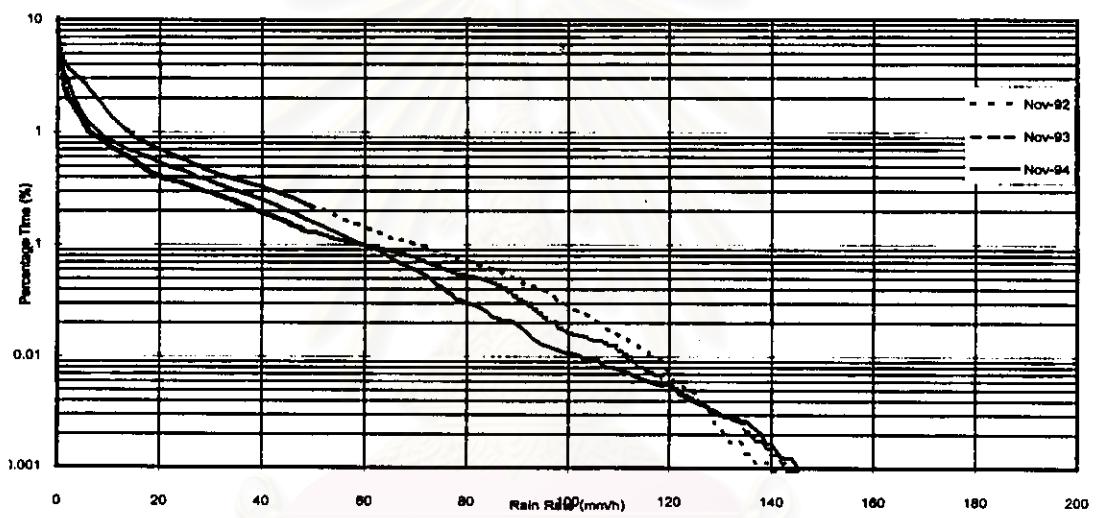

Monthly Rainfall Rate Statistic, Singapore, September 1992(720 hour), 1993(720 hours), 1994(696 hours)

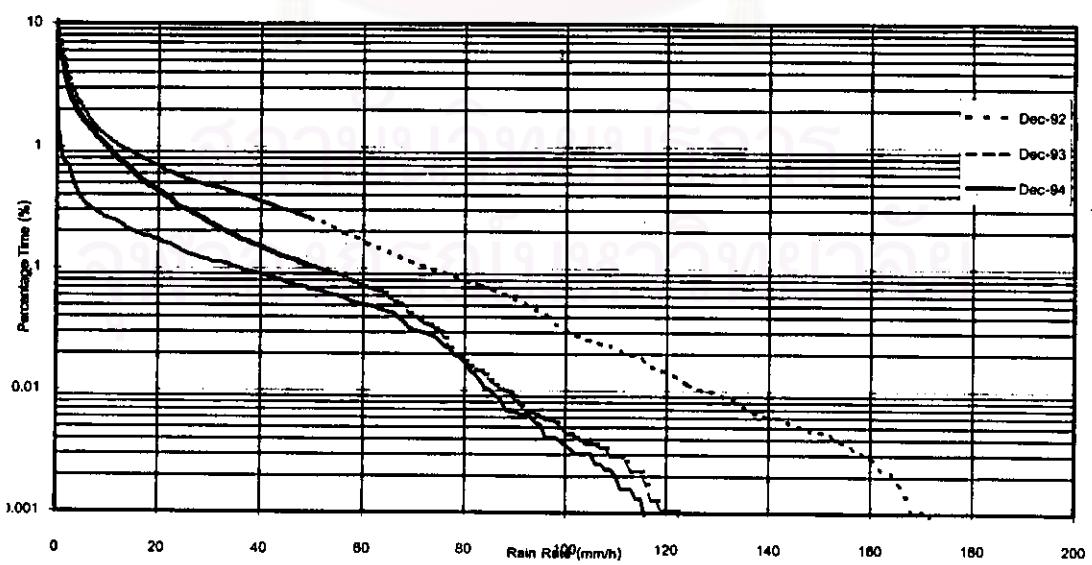

Monthly Rainfall Rate Statistic, Singapore, October 1992(480 hour), 1993(744 hours), 1994(744 hours)

Monthly Rainfall Rate Statistic, Singapore, November 1992(720 hour), 1993(720 hours), 1994(696 hours)

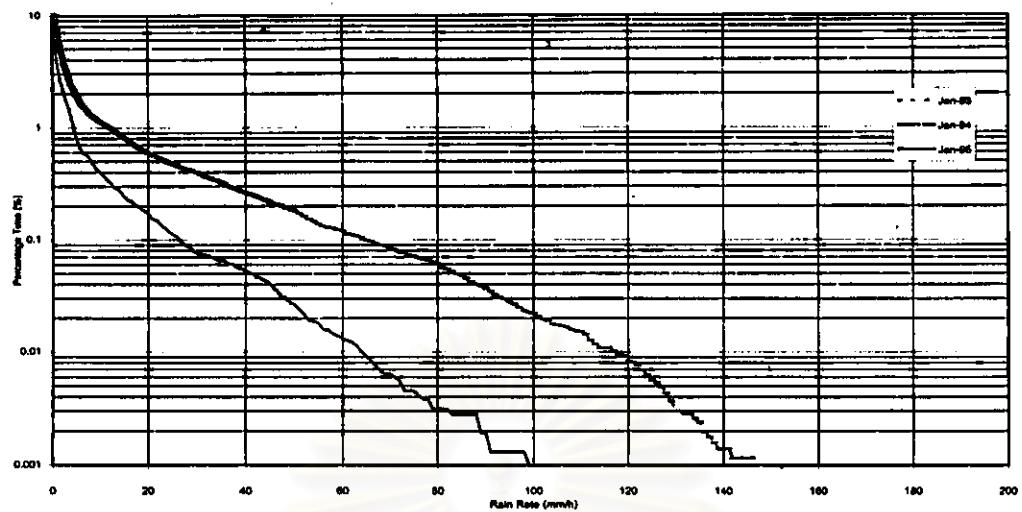

Monthly Rainfall Rate Statistic, Singapore, December 1992(744 hour), 1993(744 hours), 1994(288 hours)

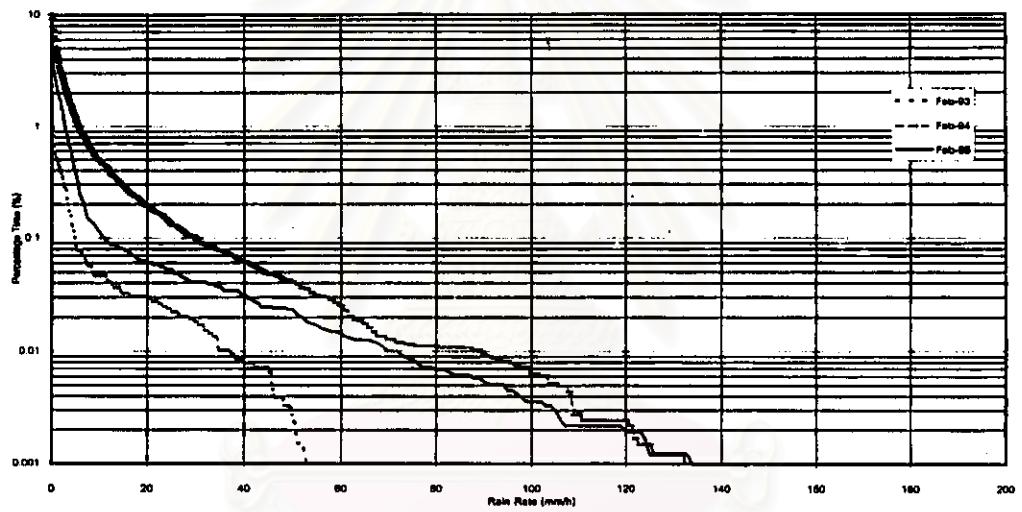

#### 4. Bandung, Monthly Cumulative Distribution, 1/Mar/92 - 28/Feb/95

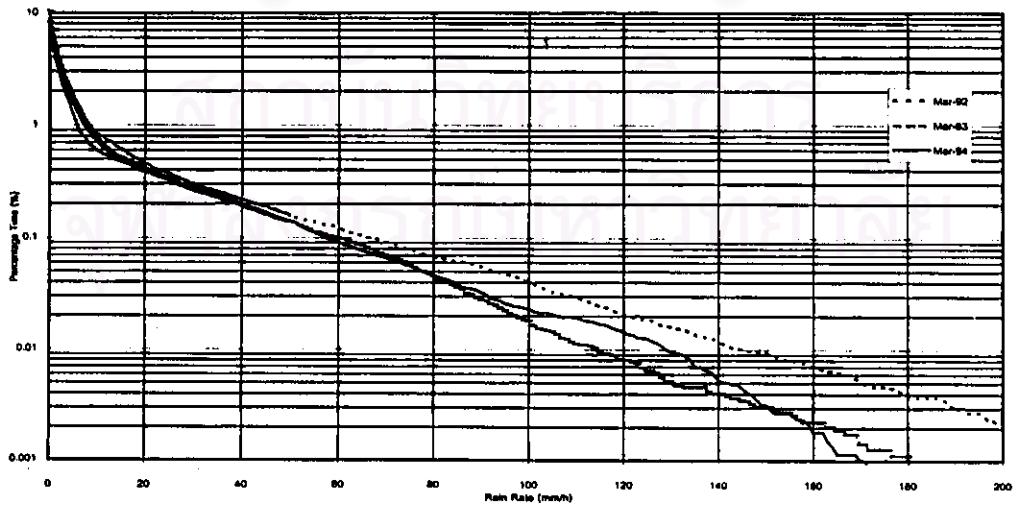

Monthly Rainfall Rate Statistic, Bandung, January, 1993(Loss Data), 1994(720 hours), 1995(744 hours)

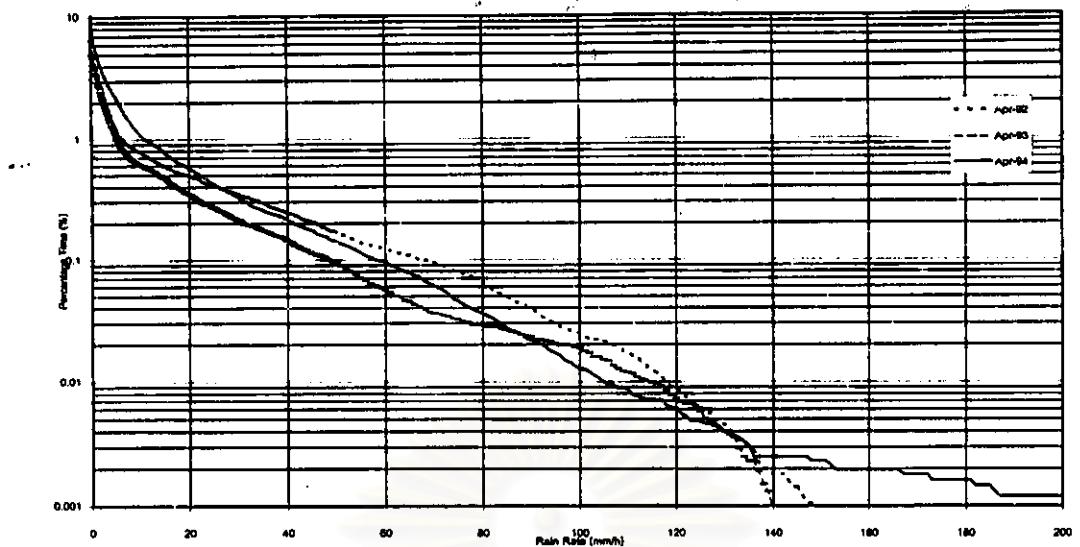

Monthly Rainfall Rate Statistic, Bandung, February, 1993(380 hour), 1994(672 hours), 1995(504 hours)

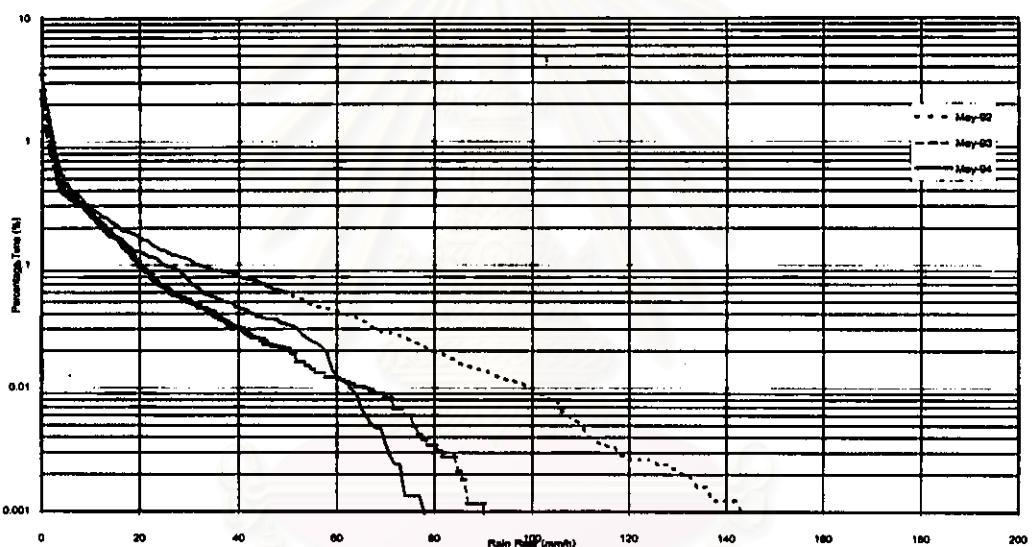

Monthly Rainfall Rate Statistic, Bandung, March, 1992(744 hour), 1993(744 hours), 1994(744 hours)

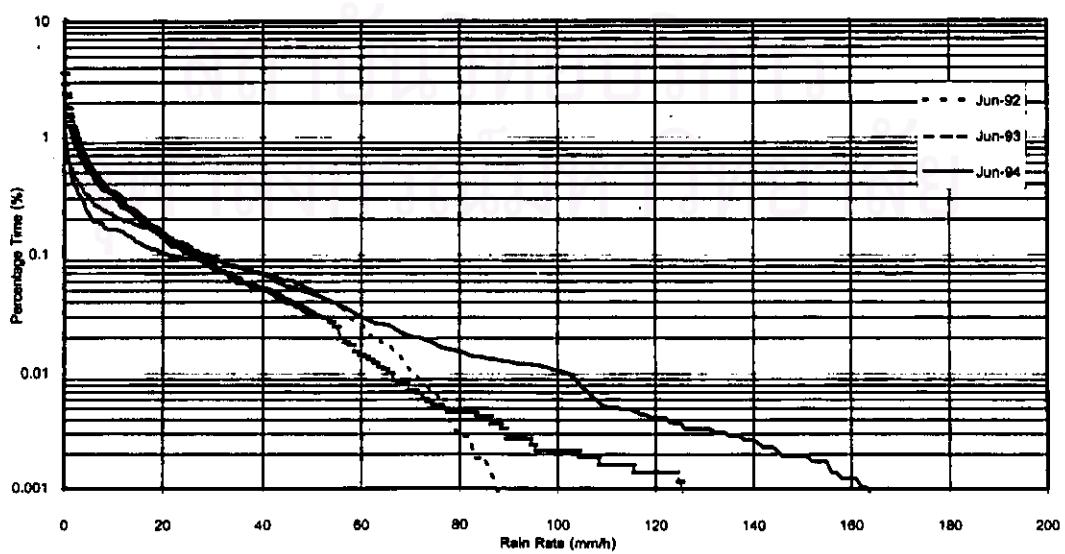

Monthly Rainfall Rate Statistic, Bandung, April, 1992(576 hour), 1993(696 hours), 1994(720 hours)

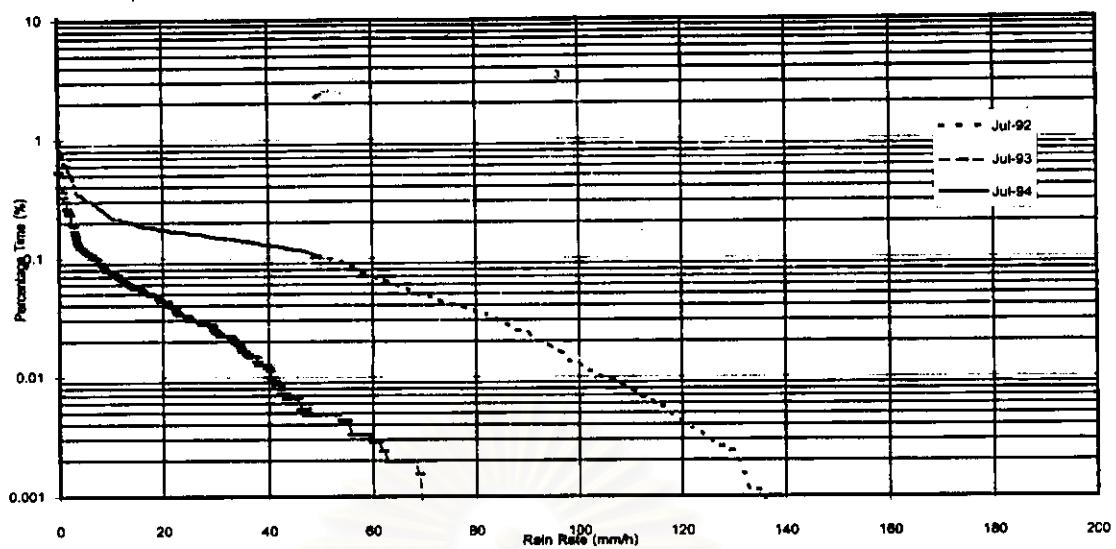

Monthly Rainfall Rate Statistic, Bandung, May, 1992(744 hour), 1993(720 hours), 1994(744 hours)

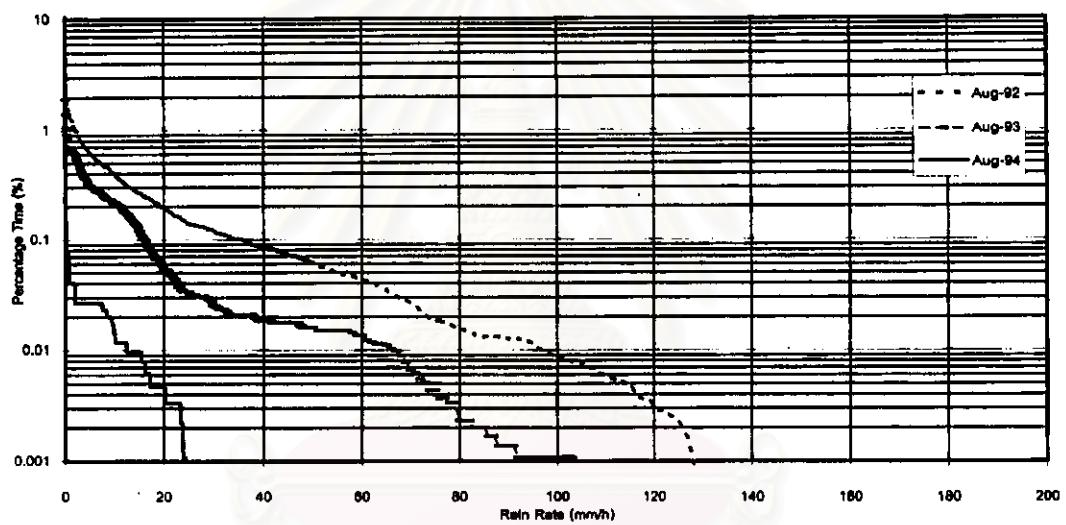

Monthly Rainfall Rate Statistic, Bandung, June, 1992(720 hour), 1993(720 hours), 1994(720 hours)

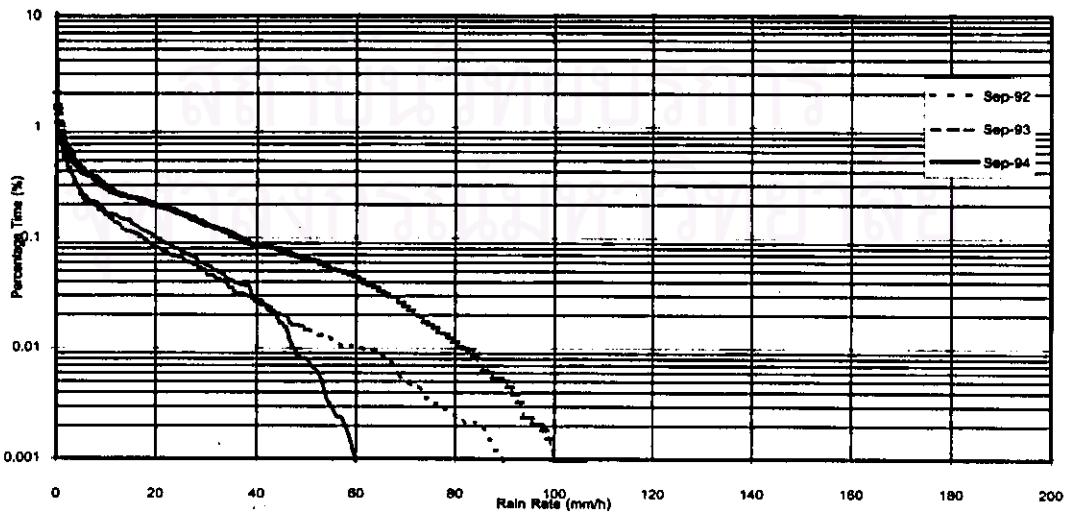

Monthly Rainfall Rate Statistic, Bandung, July, 1992(744 hour), 1993(744 hours), 1994(Loss Data)

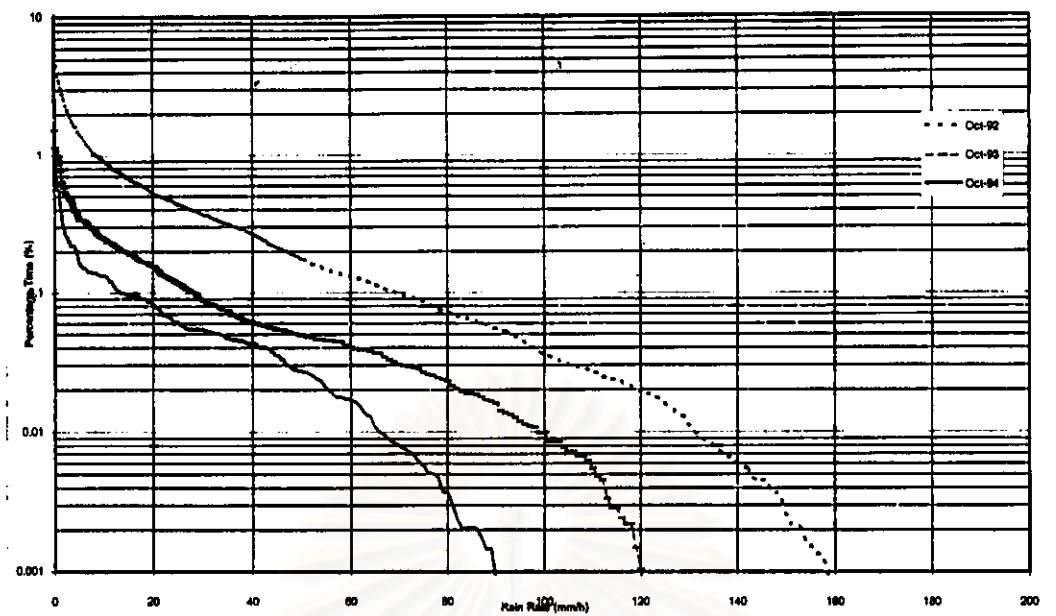

Monthly Rainfall Rate Statistic, Bandung, August, 1992(744 hour), 1993(744 hours), 1994(744 hours)

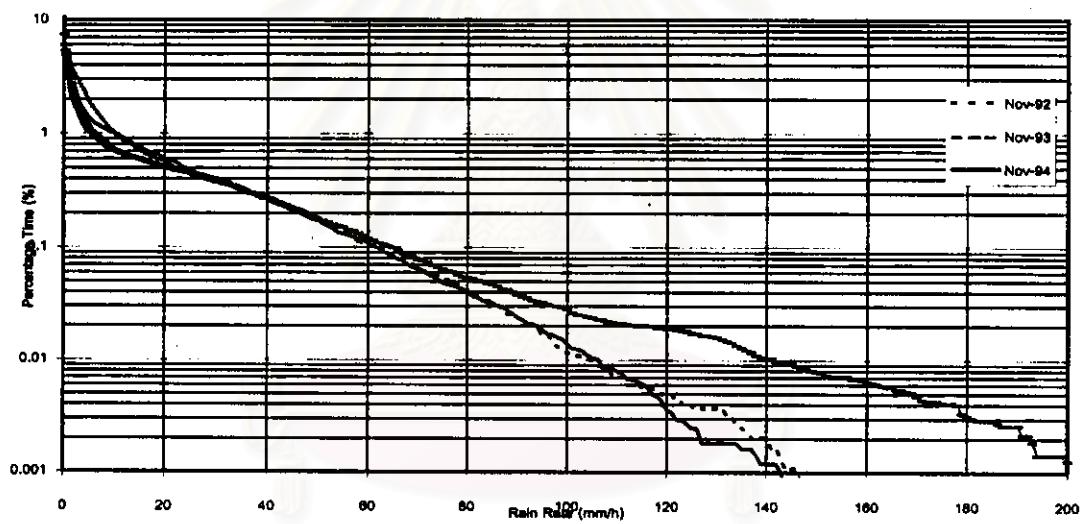

Monthly Rainfall Rate Statistic, Bandung, September, 1992(720 hour), 1993(720 hours), 1994(672 hours)

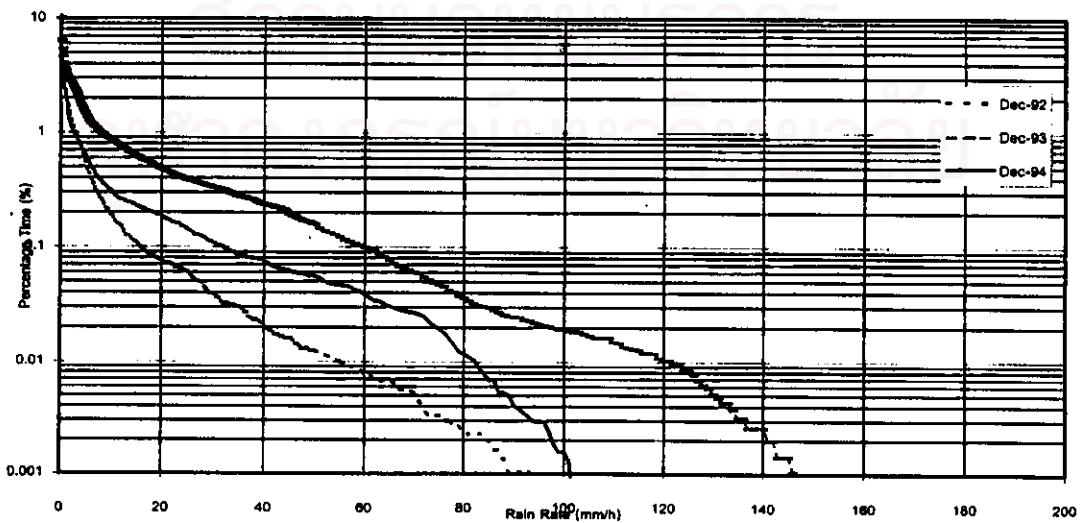

Monthly Rainfall Rate Statistic, Bandung, October, 1992(744 hour), 1993(744 hours), 1994(744 hours)

Monthly Rainfall Rate Statistic, Bandung, November, 1992(720 hour), 1993(720 hours), 1994(696 hours)

Monthly Rainfall Rate Statistic, Bandung, December, 1992(408 hour), 1993(744 hours), 1994(744 hours)

Remark: The rows indicate the monthly names starting from March 1992 to February 1995. The columns show the measured rain intensity exceeded the threshold at particular percentage time.

## Estimation of Parameters for the Best fit Probability Distribution

After a candidate of distribution e.g., an exponential distribution, have been hypothesized. We must selected the approximated value of their parameters to be the best fit to the measured distribution. There are many methods to evaluate the quality of the estimators such as: the maximum-likelihood estimators (MLE), the lease-squares estimators (LSE), the moment method. The MLE has good potential to justify the chi-square goodness-of-fit test. In our analysis, the MLE was selected to evaluate the quality of estimation.

### Estimation of parameters ( $\mu, \rho$ ) of point-rain intensity distribution

The exponential distribution of the measured rain-intensity is given in equation (4.4) as

$$P(R > \gamma) = (\rho/\mu) \exp(-R/\mu) \quad \dots \quad (A1)$$

where:  $\rho$  is a constant that scales the curves and  $\mu$  is a constant that modifies the shape and the slope of the curve.

The MLE is defined as:  $L(\mu, \rho) = P_{\mu\rho}(R_1) P_{\mu\rho}(R_2) \dots P_{\mu\rho}(R_n) \quad \dots \quad (A2)$

$$= (\rho/\mu) \exp(-R_1/\mu) (\rho/\mu) \exp(-R_2/\mu) \dots (\rho/\mu) \exp(-R_n/\mu) \quad (A3)$$

$$= (\rho/\mu)^n \exp(-1/\mu \sum R_i) \quad (A4)$$

Take the Logarithm function

$$\ln(L(\mu, \rho)) = n \ln(\rho/\mu) - 1/\mu \sum R_i \quad (A5)$$

Maximizing  $L(\mu, \rho)$  is equivalent to maximizing  $\ln(\mu, \rho)$  and  $\bar{\mu}, \bar{\rho}$  maximized  $L(\mu, \rho)$  if and only if  $\bar{\mu}, \bar{\rho}$  maximized  $\ln(\mu, \rho)$ . The standard differential calculus can be used to maximize  $\ln(\mu, \rho)$  by setting its derivative to zero and solving for  $\mu$  and  $\rho$ .

$$\frac{d(\ln(\mu, \rho))}{d\mu} = n\rho/\mu + 1/\mu^2 \sum R_i = 0 \quad (A6)$$

and

$$\frac{d(\ln(\mu, \rho))}{d\rho} = n/\mu + = 0 \quad (A7)$$

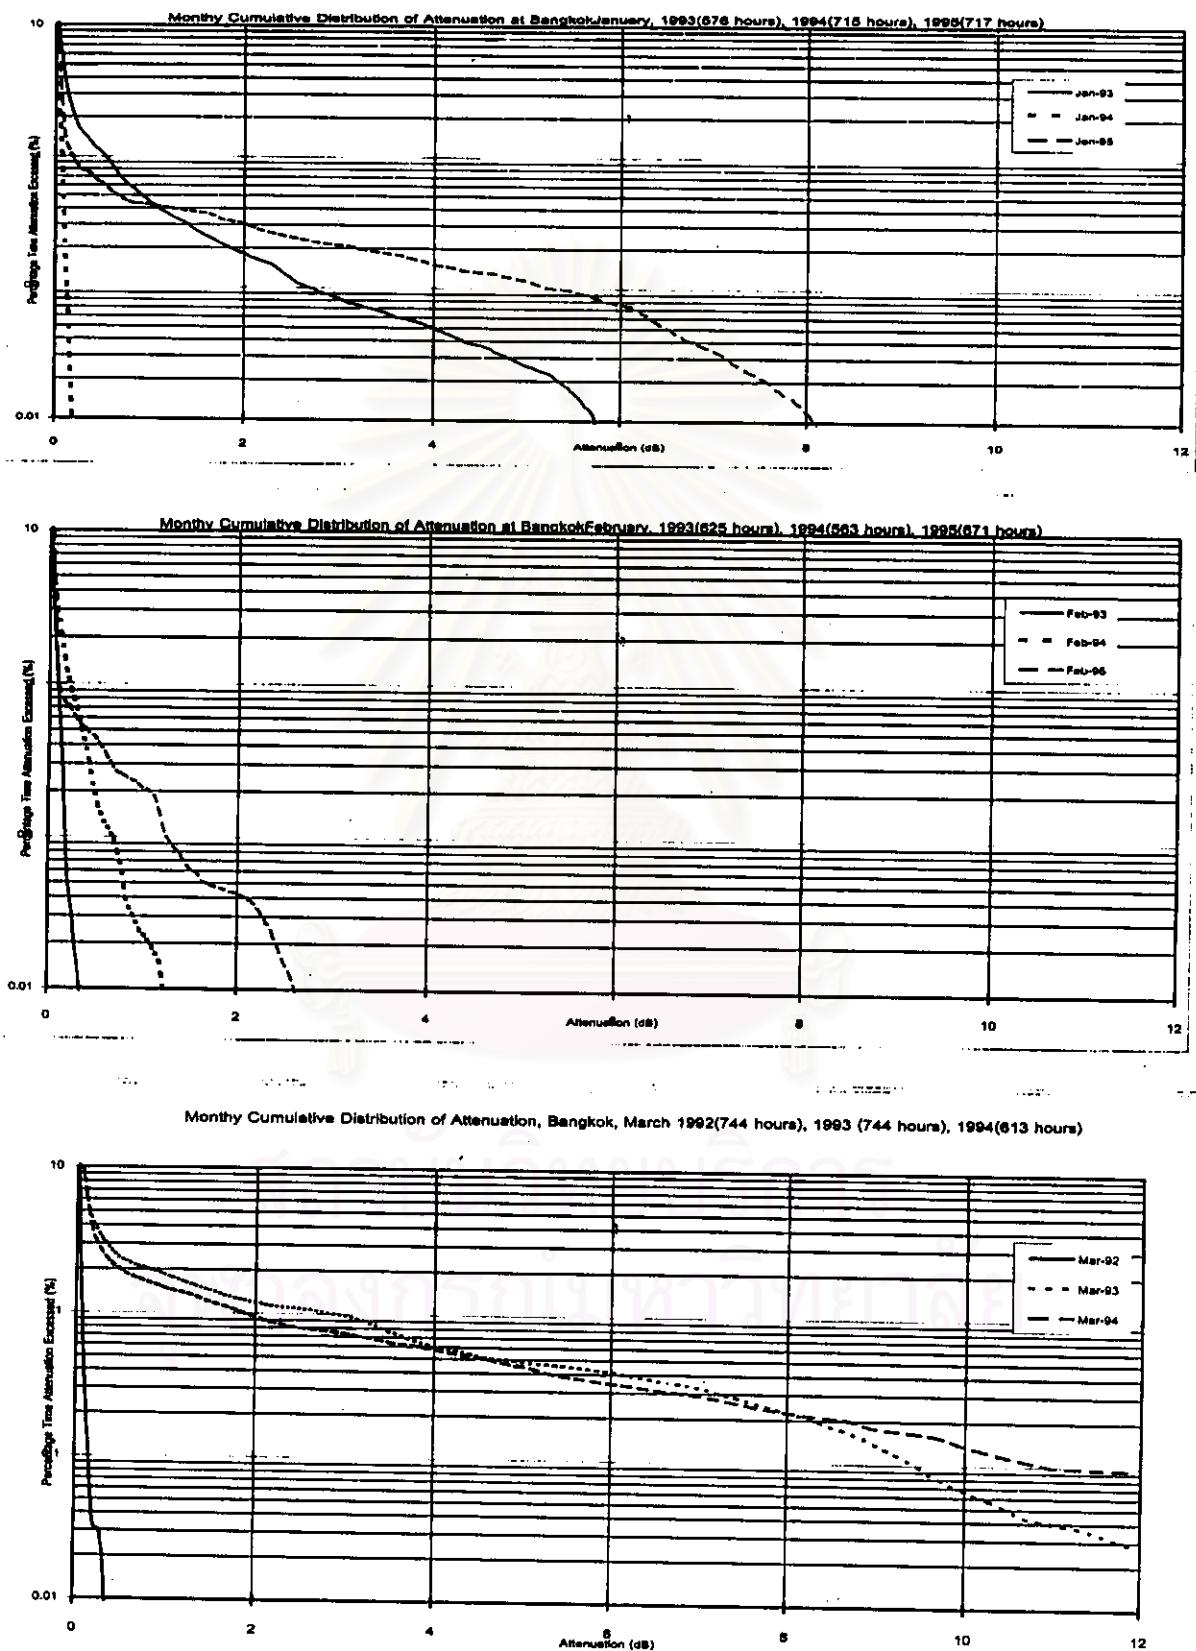

To make sure that  $\bar{\mu}, \bar{\rho}$  is maximized of  $\ln(\mu, \rho)$ , the second derivative of  $\ln(\mu, \rho)$  must be negative. The correlation coefficient is used to evaluate to fit parameters.

By solving equation (A6) and (A7), result of the parameters  $\mu, \rho$  and correlation coefficient for the exponential fit to the measured value is shown in table 4.2.

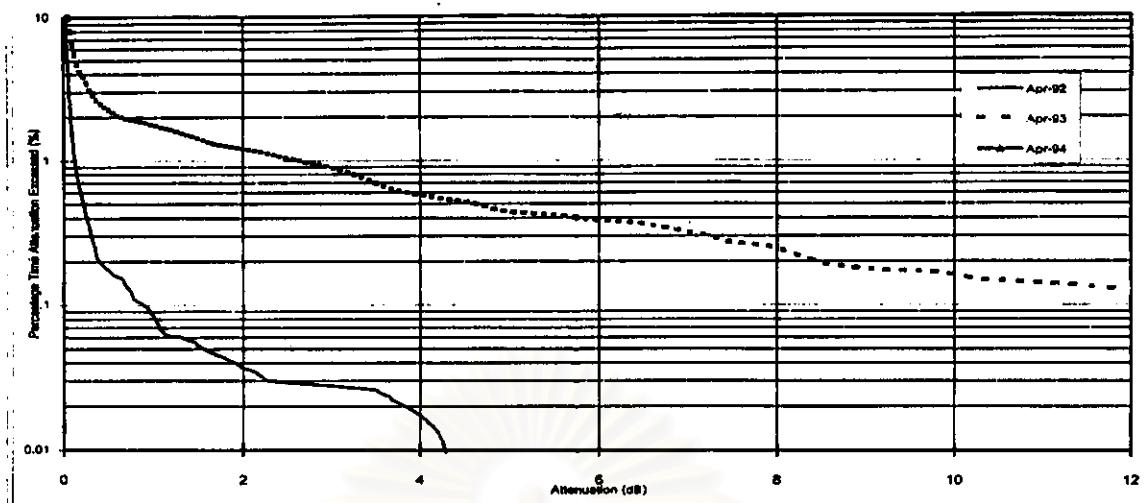

## APPENDIX - C

### Monthly Cumulative Attenuation Distributions

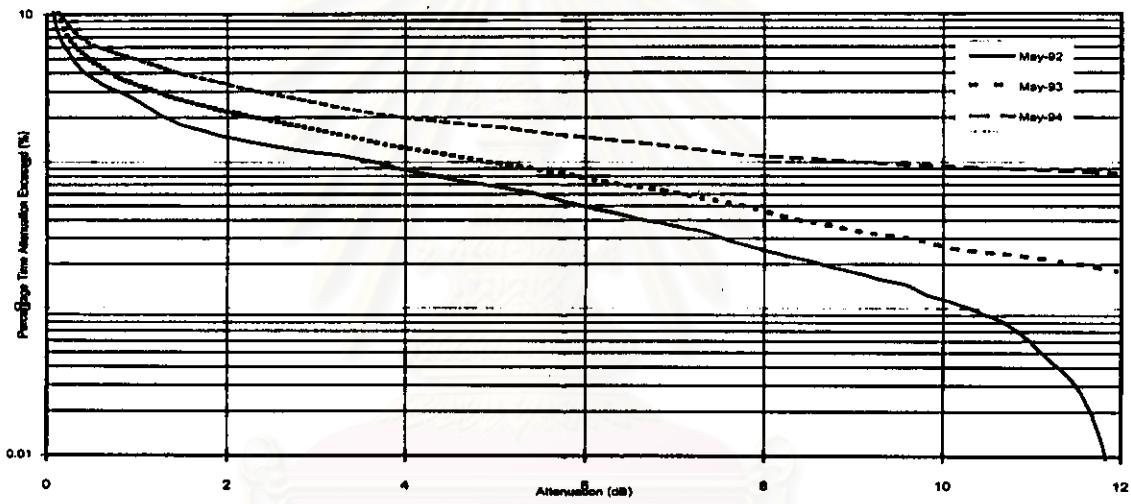

#### 1. Bangkok Attenuation Distribution 1/March/92 - 28/Feb./95, N. Yoothanorm et al.,[1997]

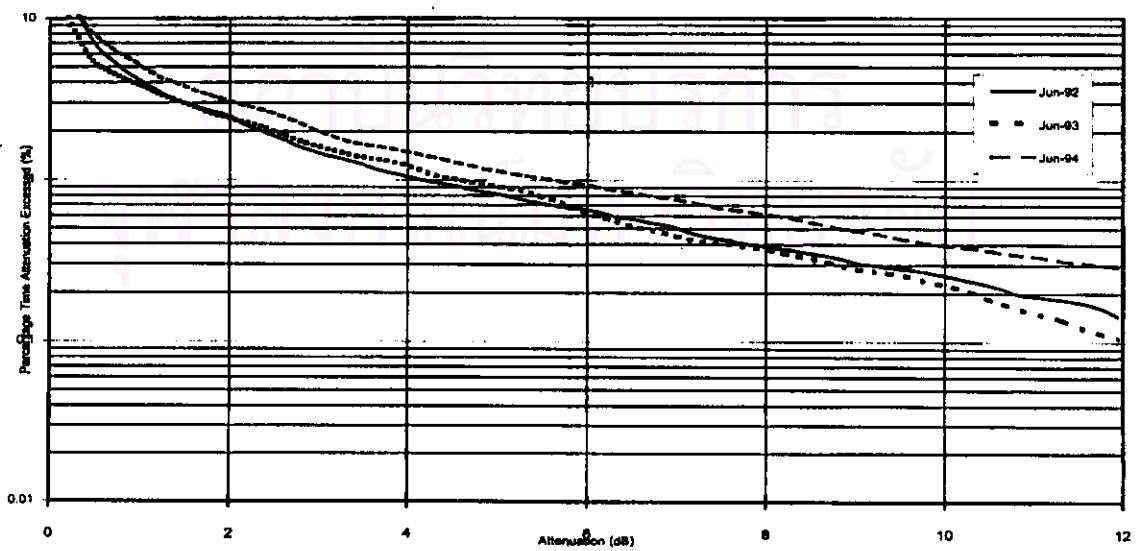

Monthly Cumulative Distribution of Attenuation at Bangkok, April, 92 (694 hours), 93 (360 hours), 94 (No Data)

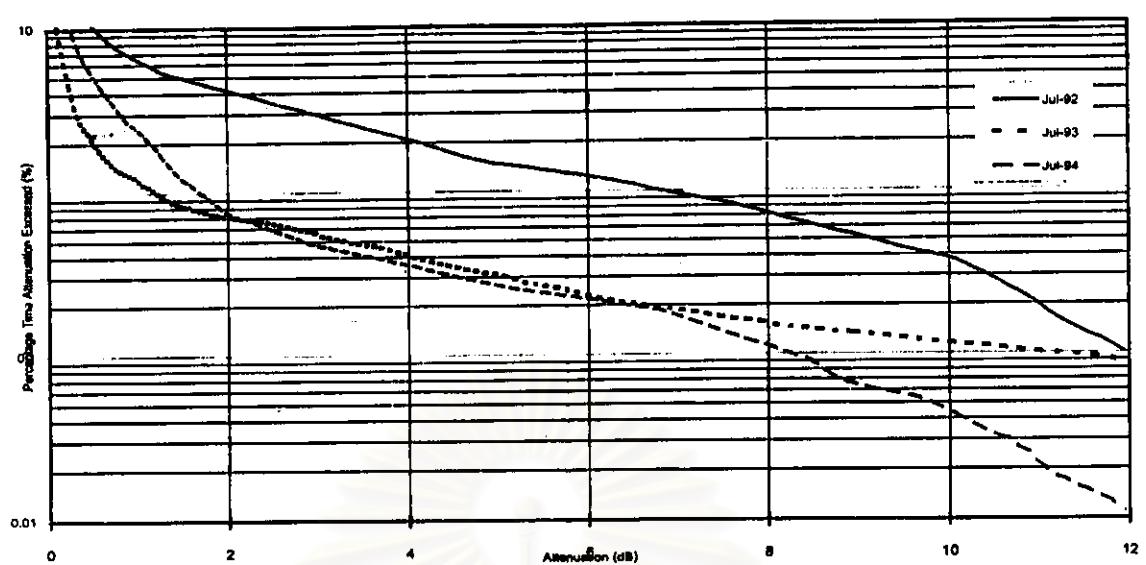

Monthly Cumulative Distribution of Attenuation at Bangkok, May, 1992 (744 hours), 1993 (656 hours), 1994(406hours)

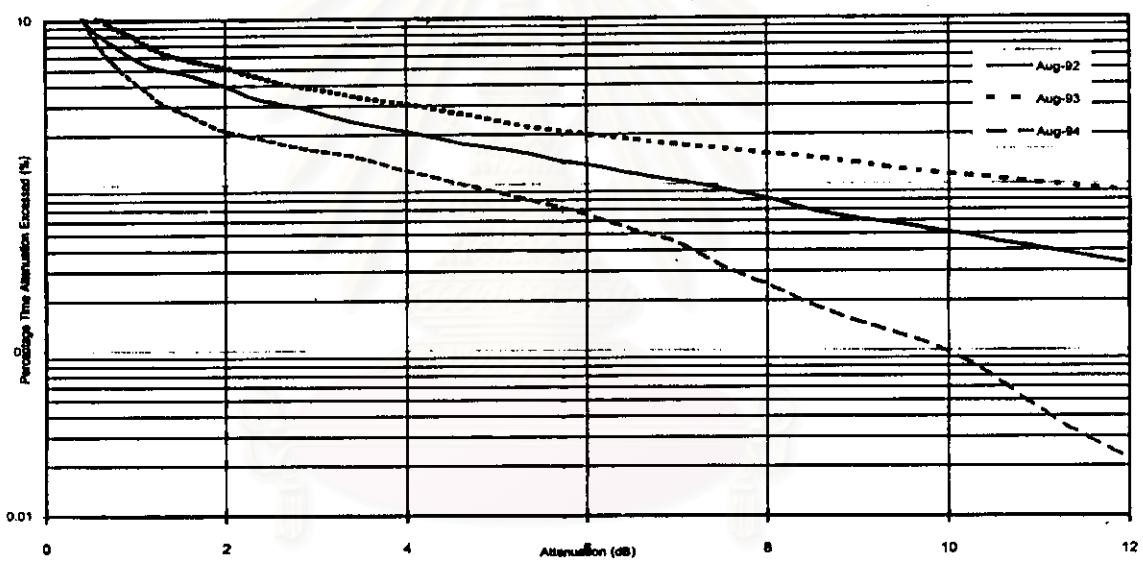

Monthly Cumulative Distribution of Attenuation at Bangkok, June, 92 (720 hours), 93 (711 hours), 94 (515 hours)

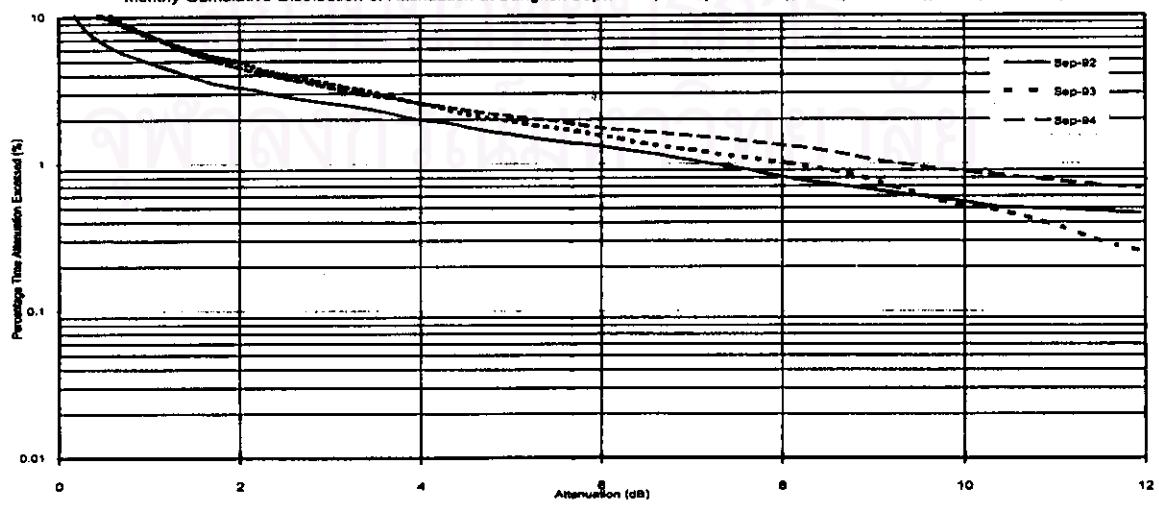

Monthly Cumulative Distribution of Attenuation at Bangkok, July, 1992 (720 hours), 1993 (663 hours), 1994 (534 hours)

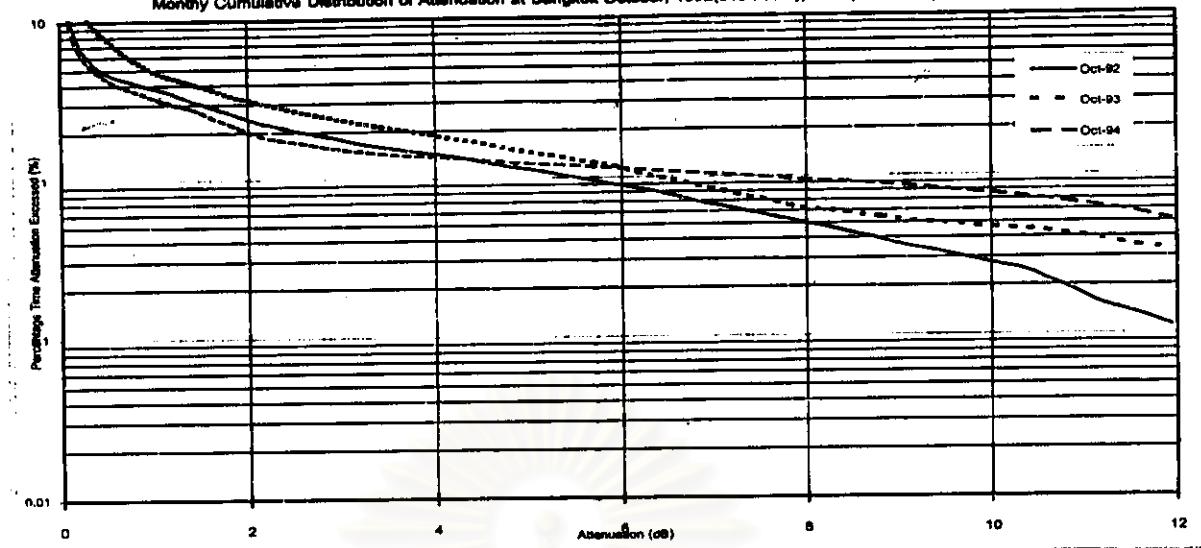

Monthly Cumulative Distribution of Attenuation at Bangkok August, 1992(744 hours), 1993(742 hours), 1994(742 hours)

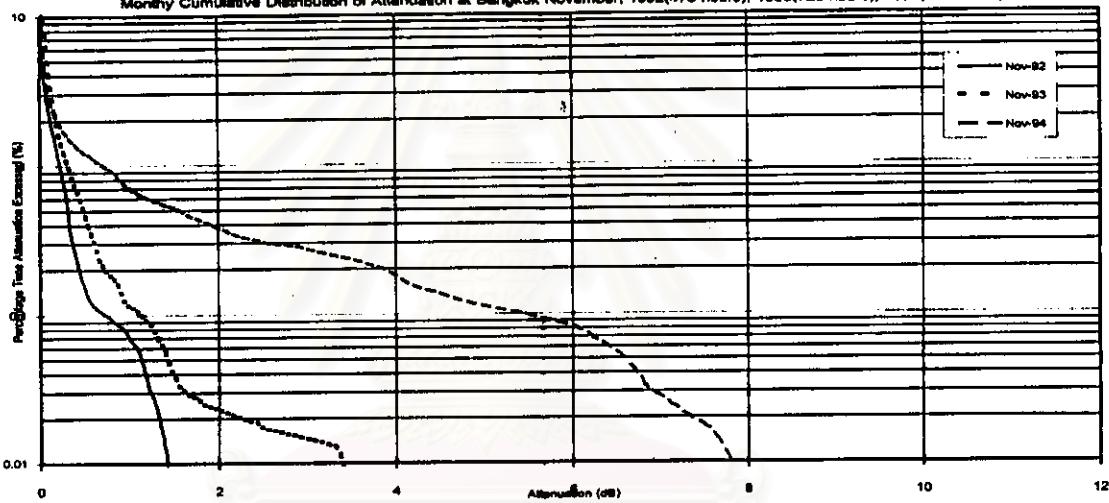

Monthly Cumulative Distribution of Attenuation at Bangkok September, 1992(720 hours), 1993(600 hours), 1994(720 hours)

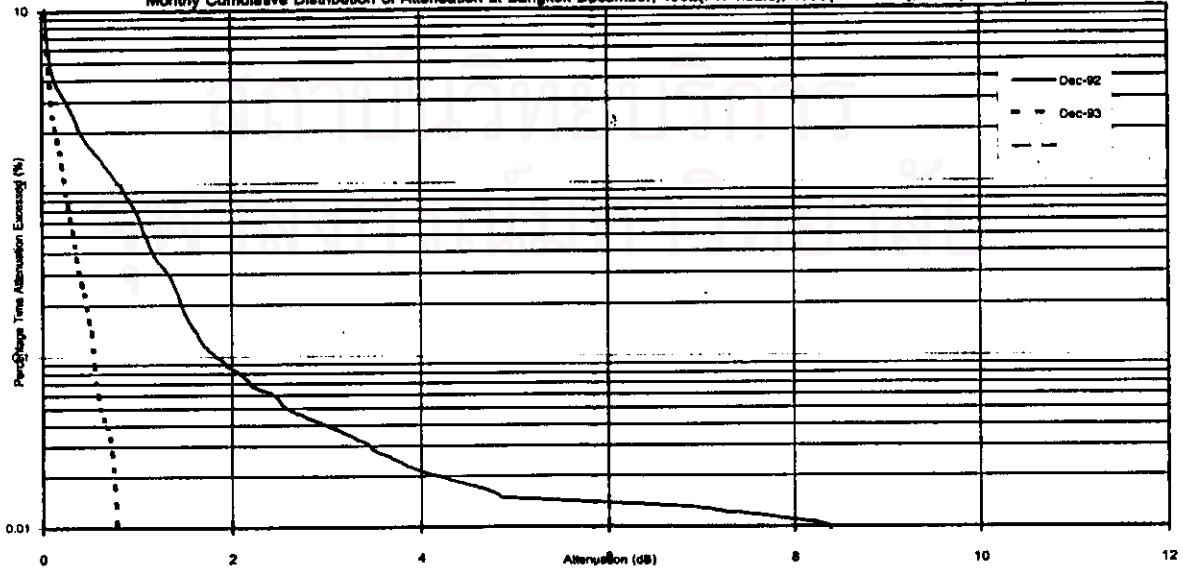

Monthly Cumulative Distribution of Attenuation at Bangkok October, 1992(318 hours), 1993(712 hours), 1994(708 hours)

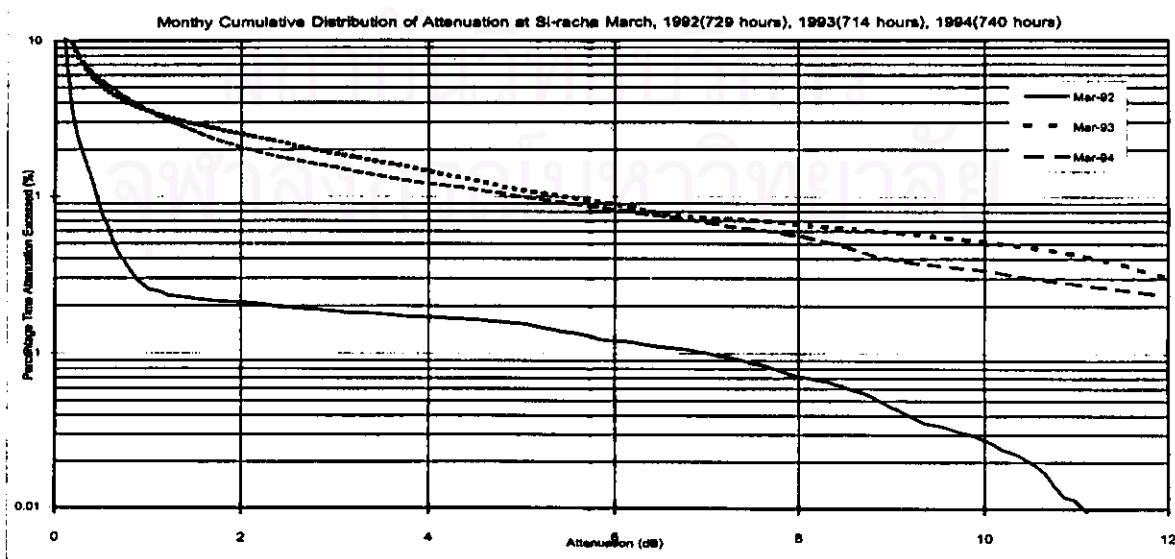

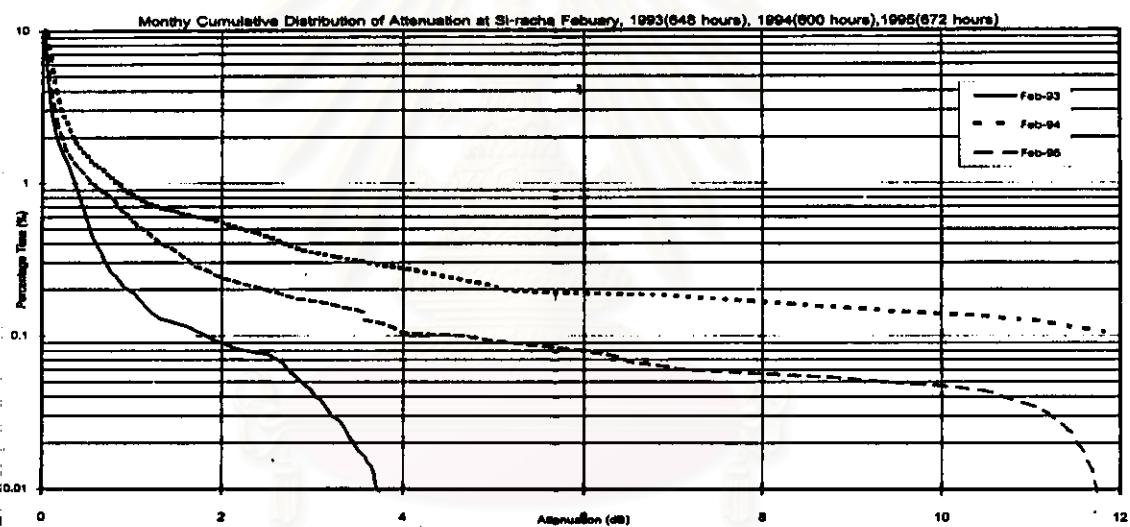

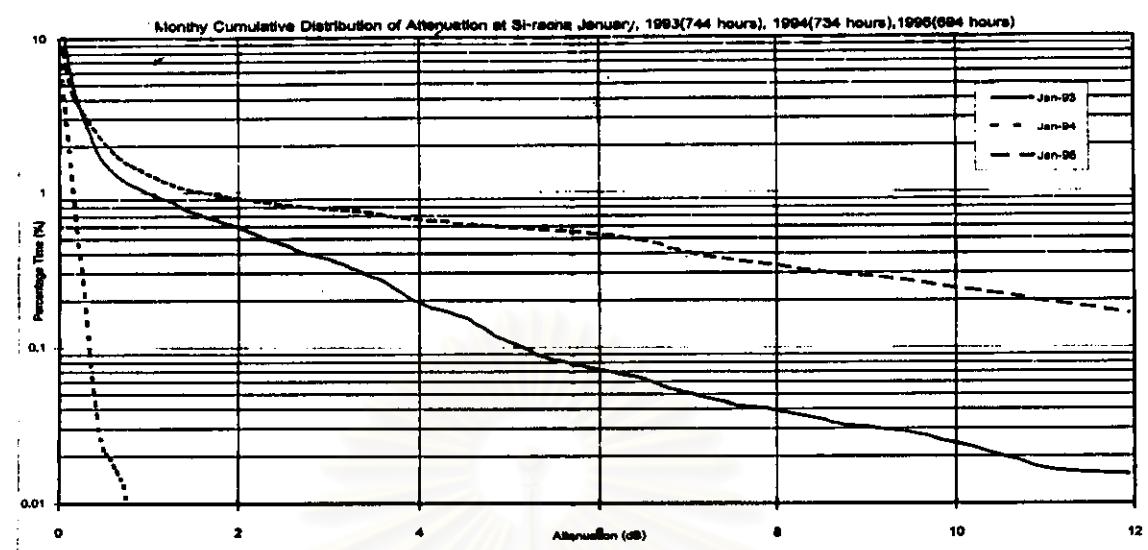

Monthly Cumulative Distribution of Attenuation at Bangkok November, 1992(478 hours), 1993(720 hours), 1994(708 hours)

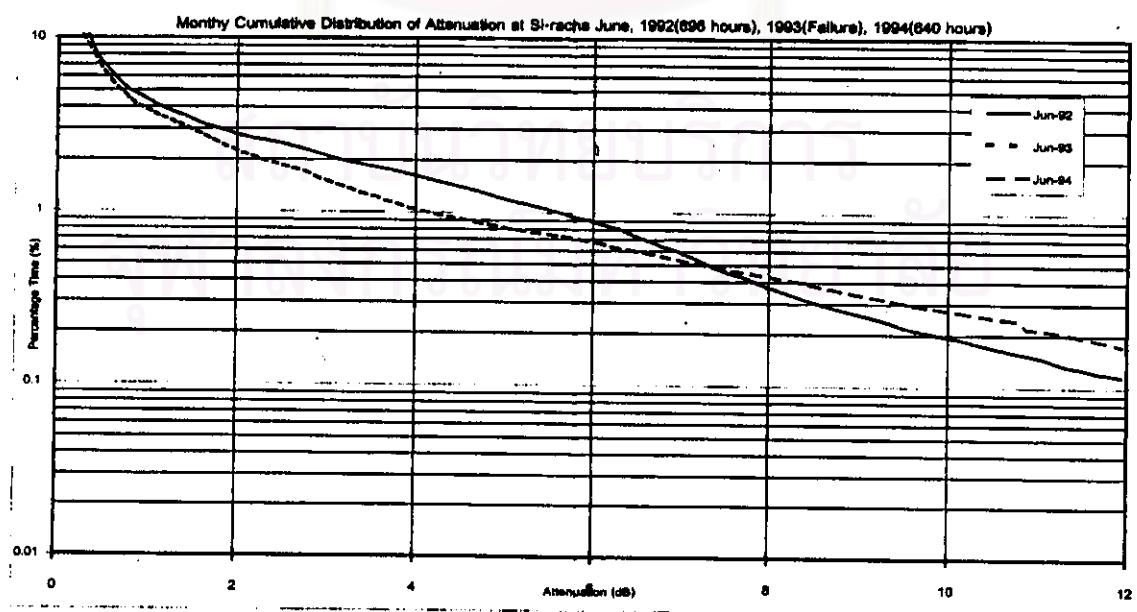

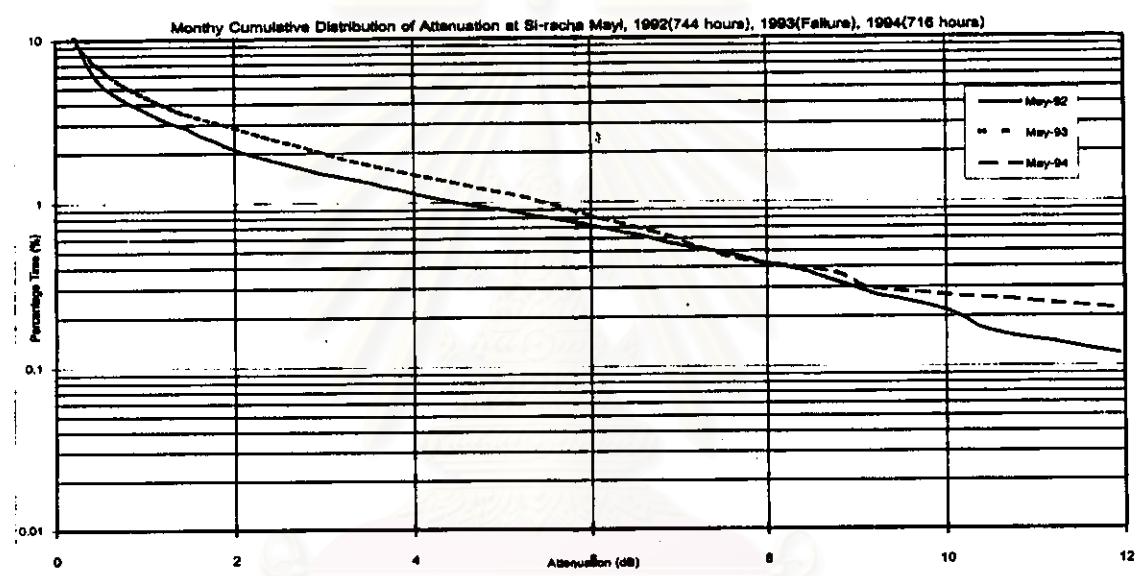

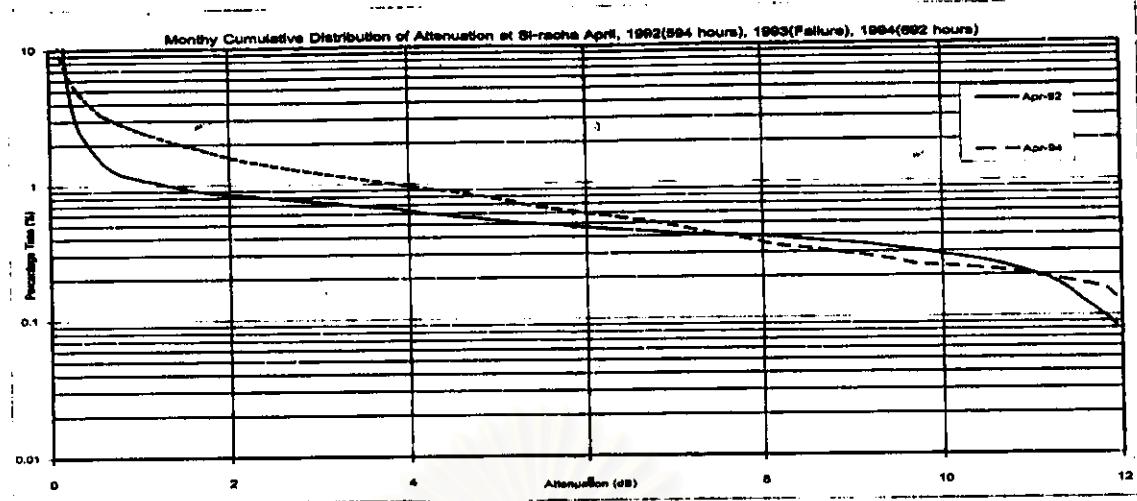

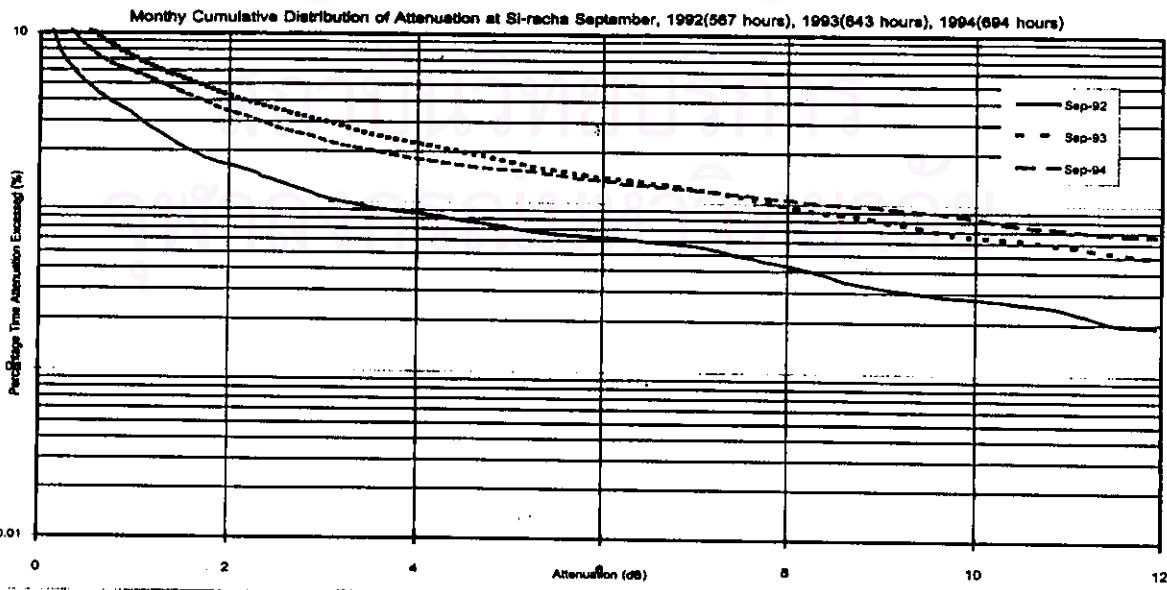

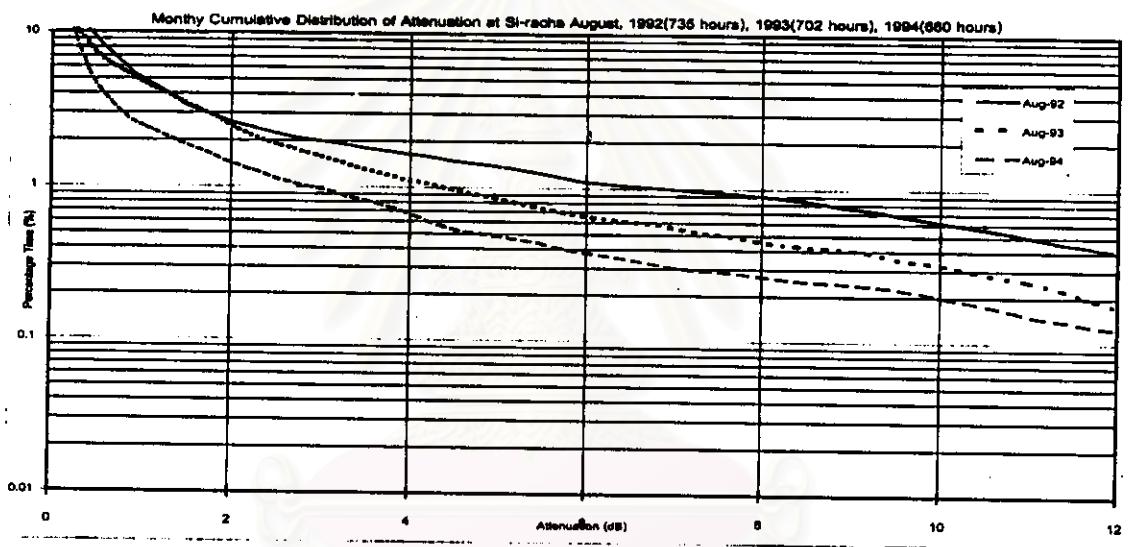

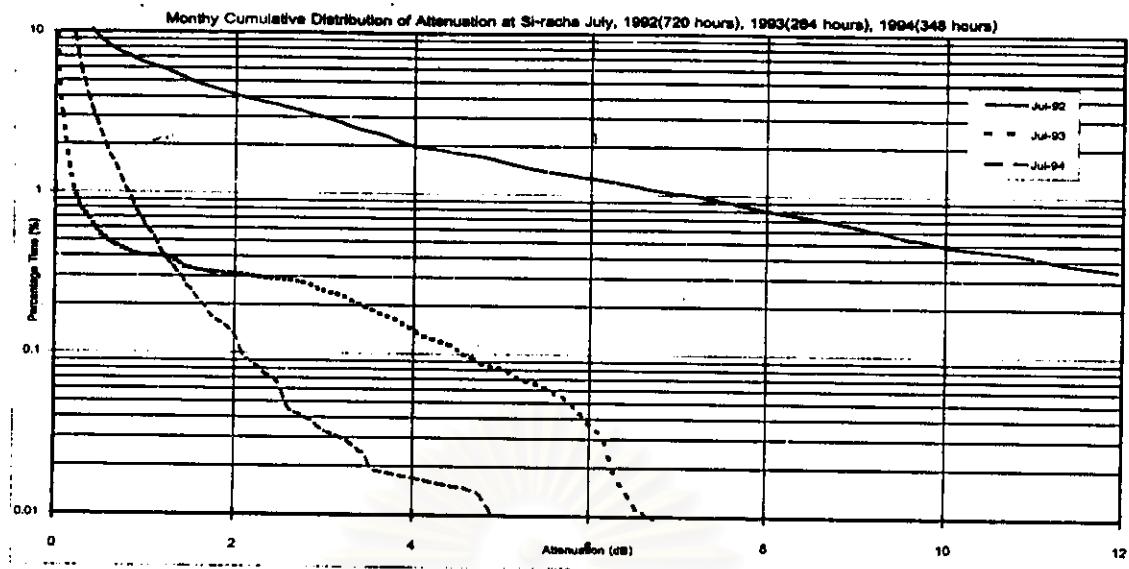

Monthly Cumulative Distribution of Attenuation at Bangkok December, 1992(717 hours), 1993(621 hours), 1994(No Data)

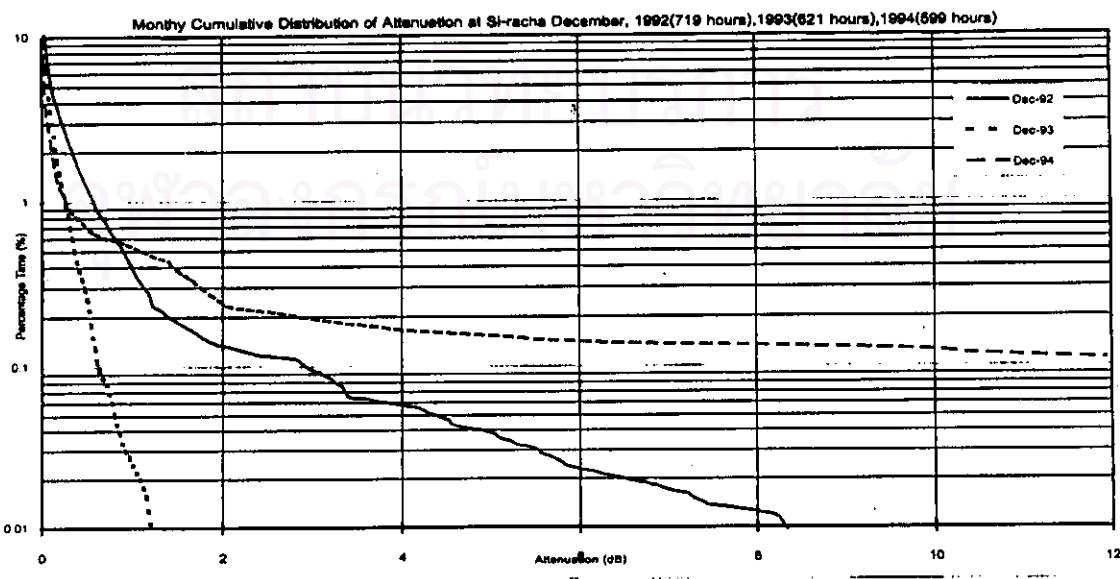

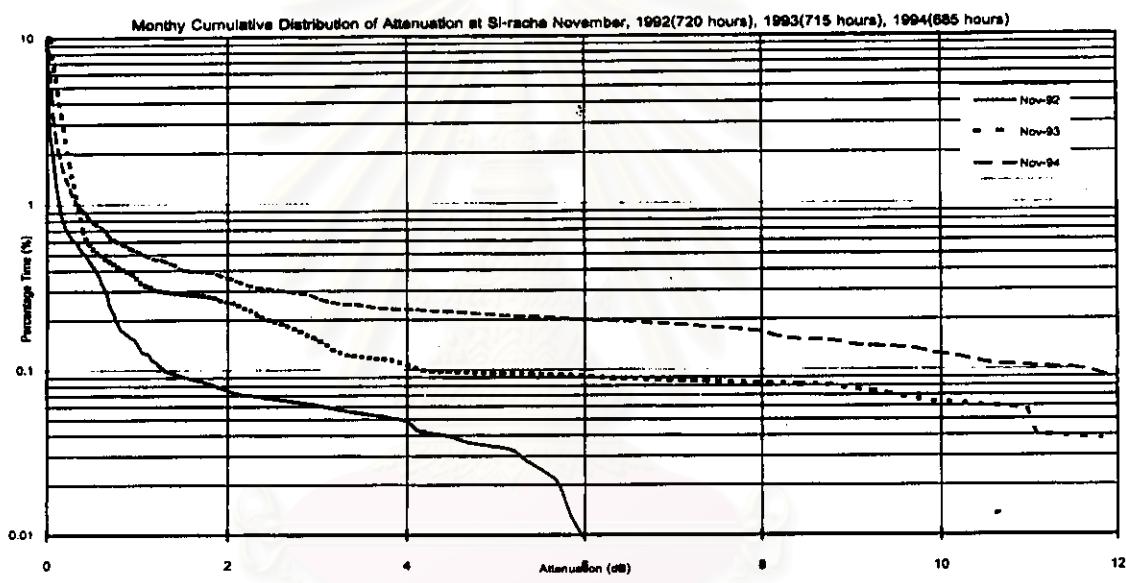

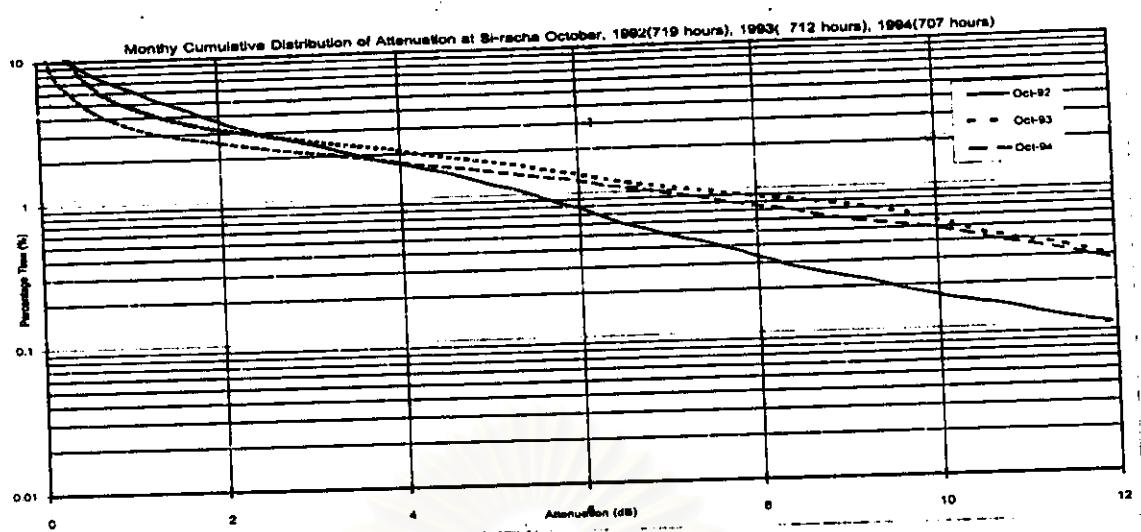

2. Si-racha, Attenuation Distribution 1/Mar/92 - 28/Feb./95, N. Yoothanorm et. al., [1997]

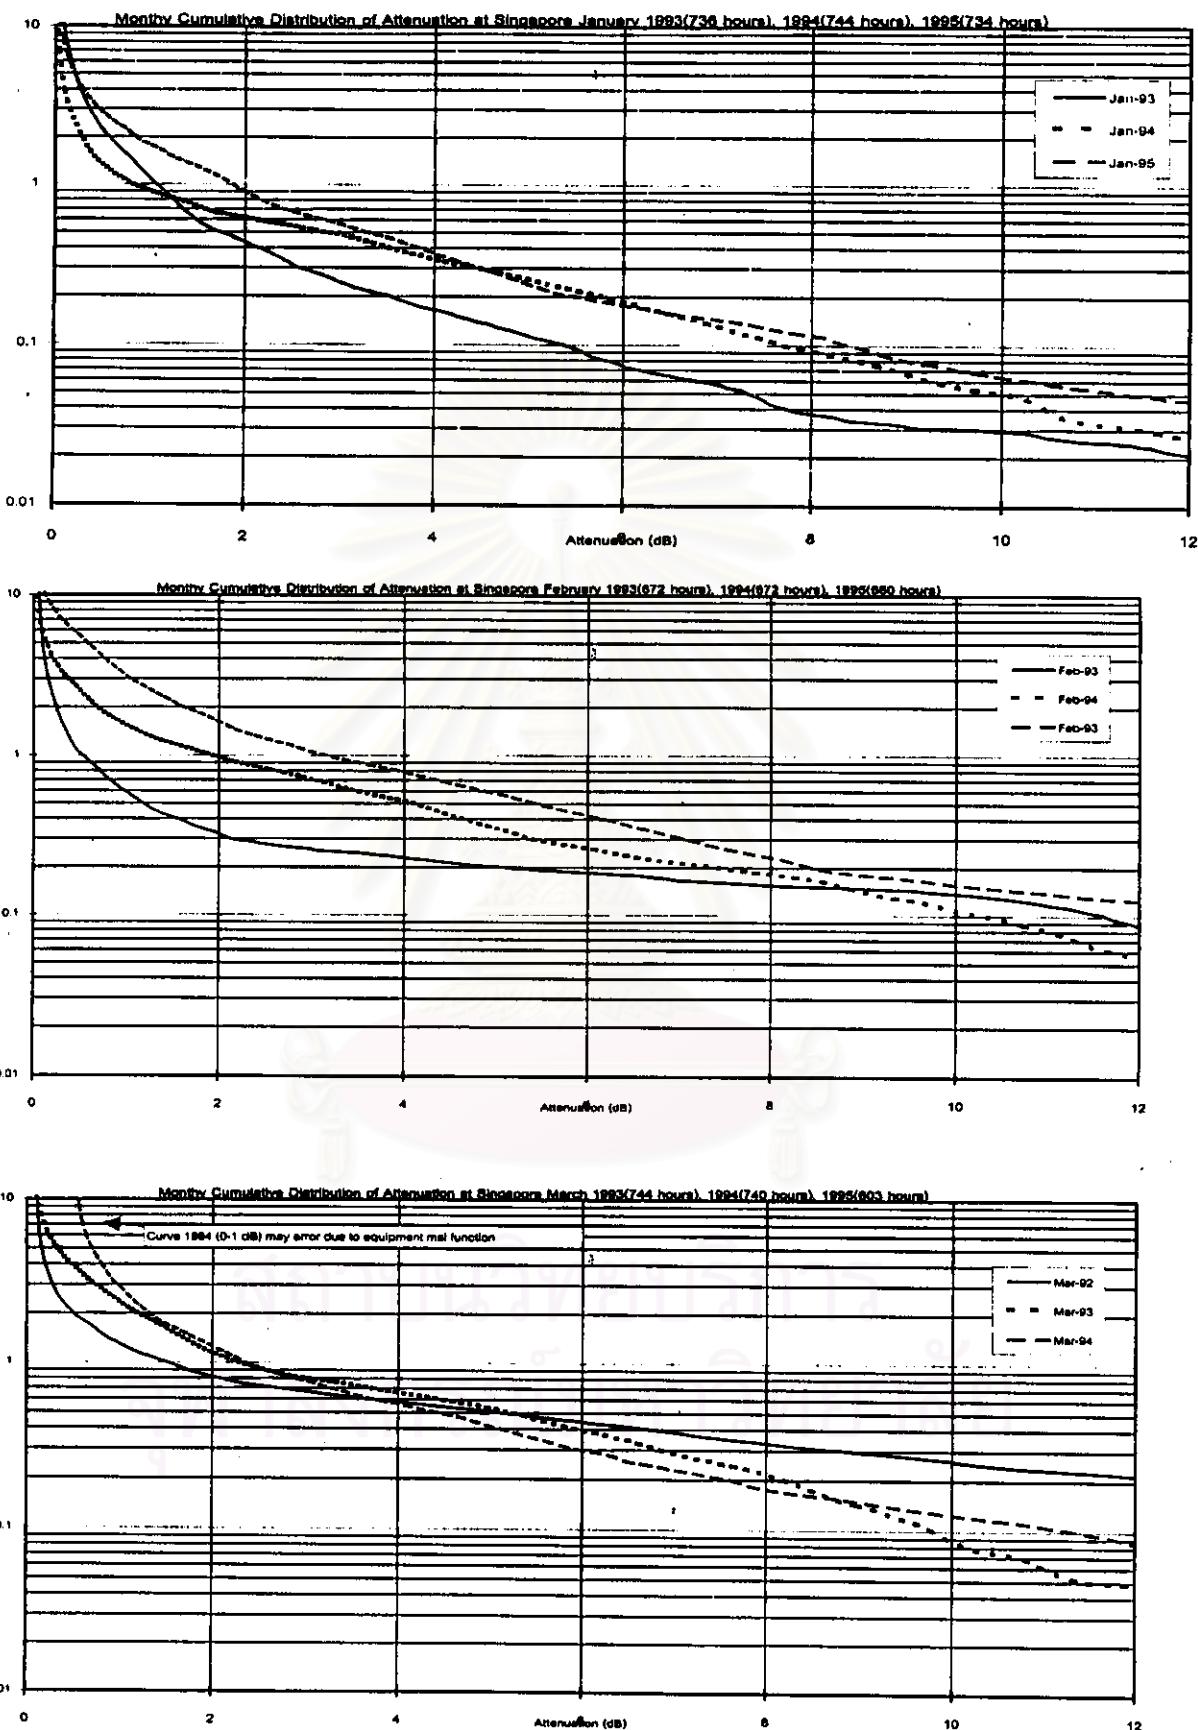

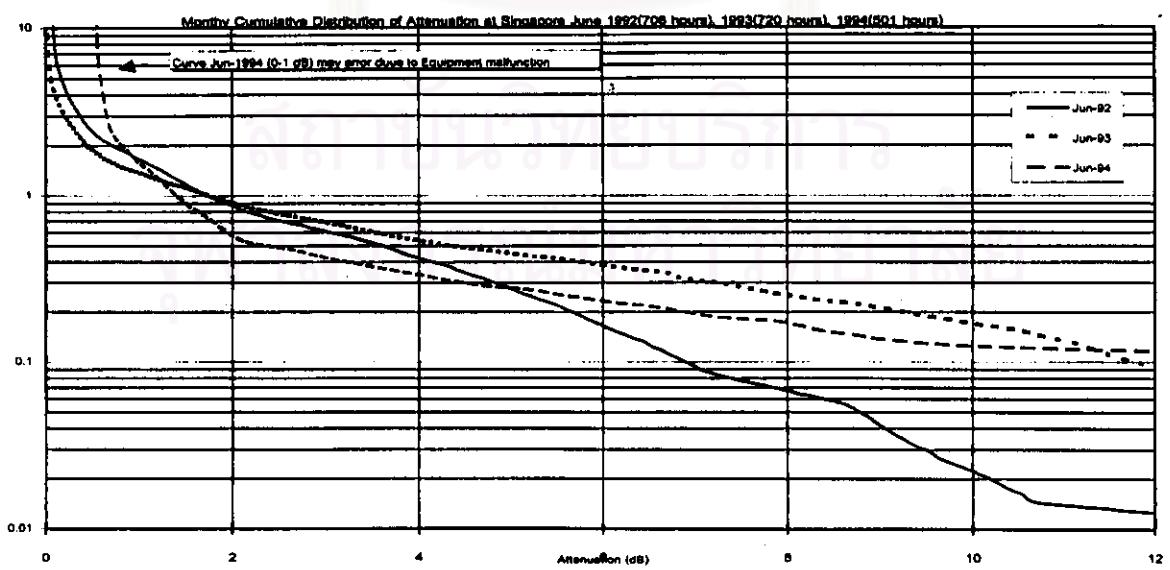

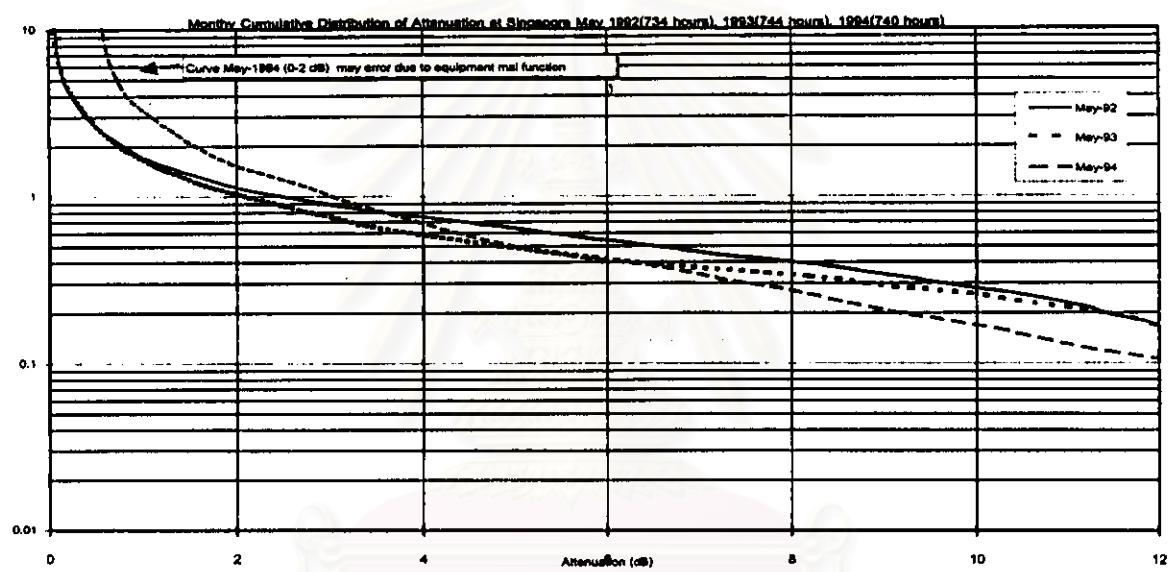

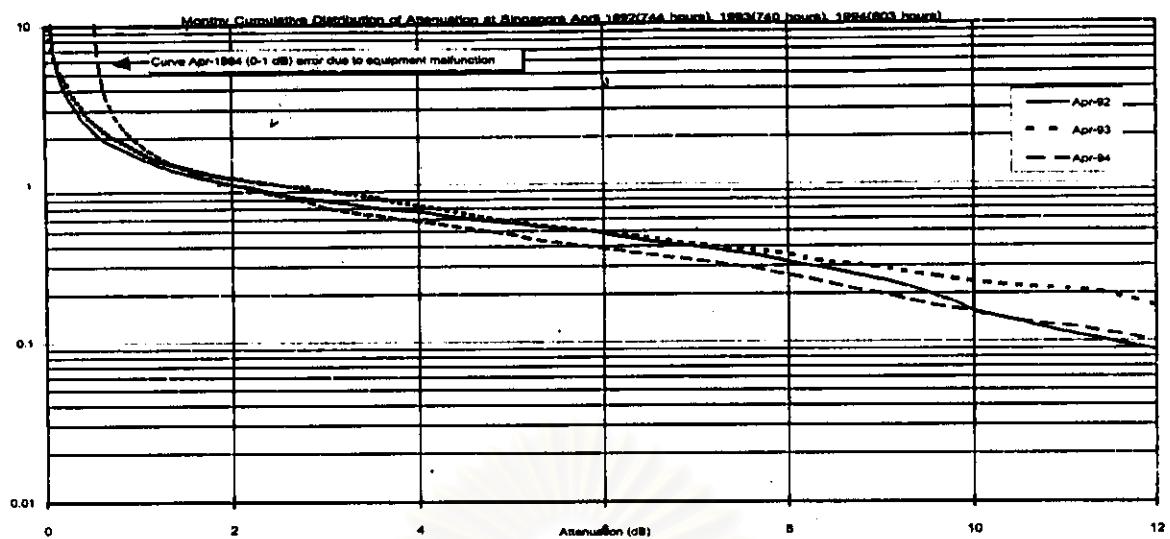

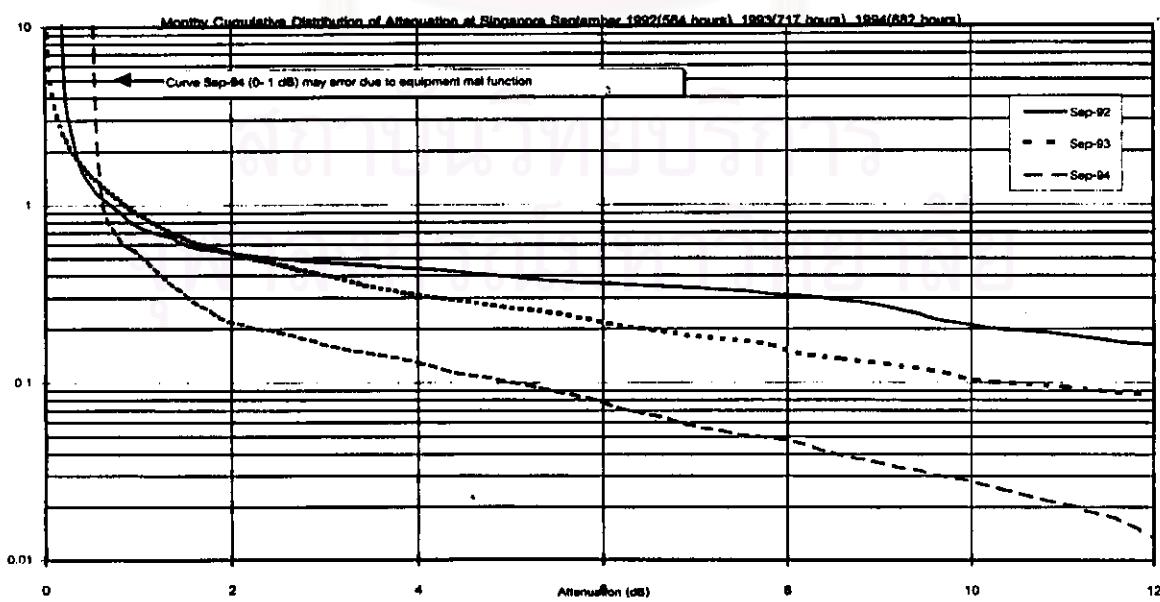

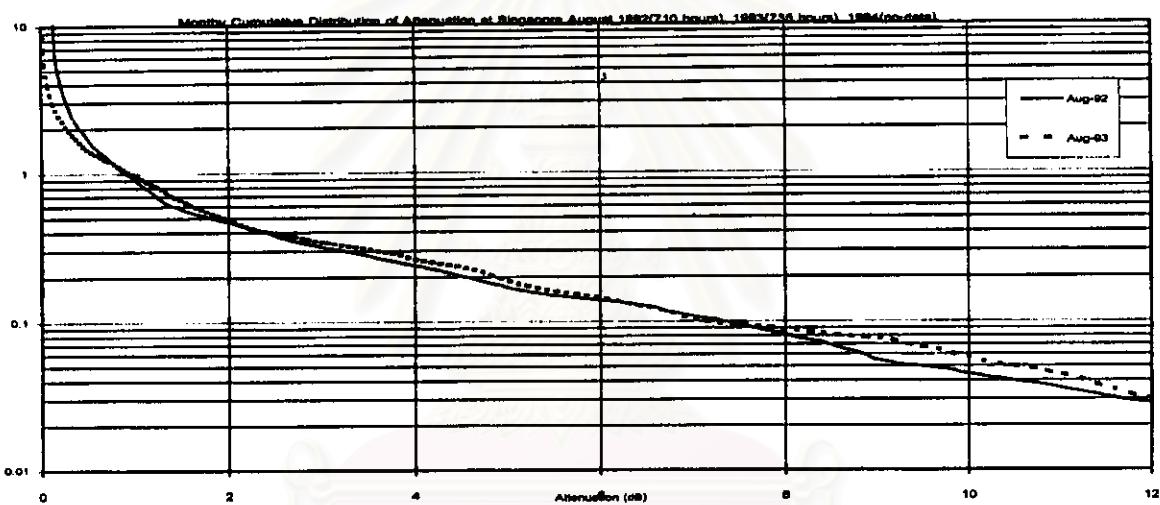

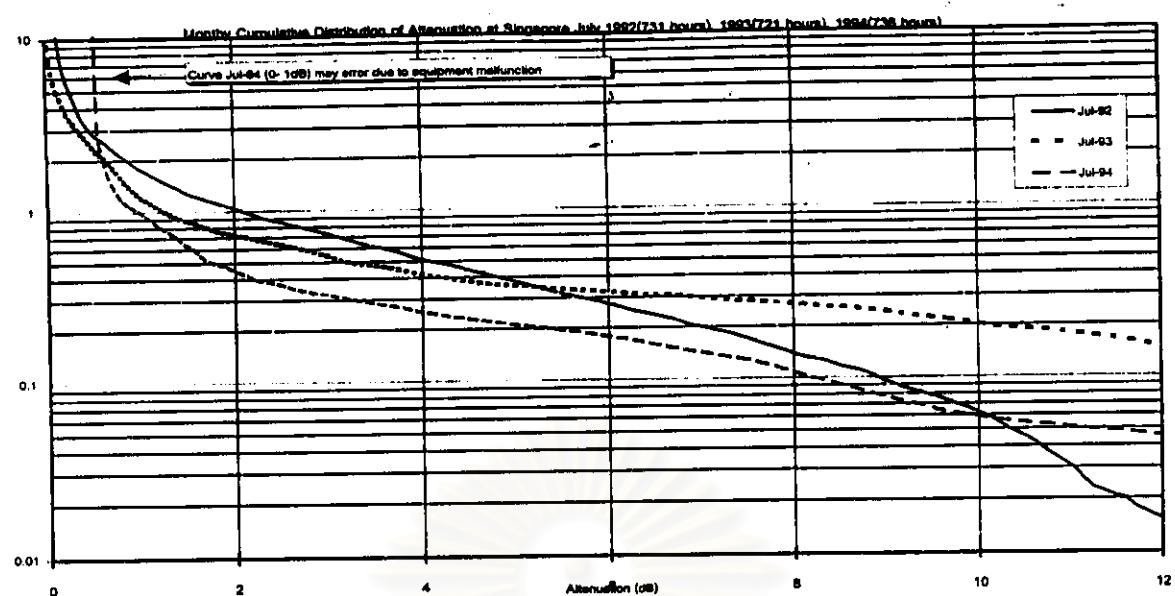

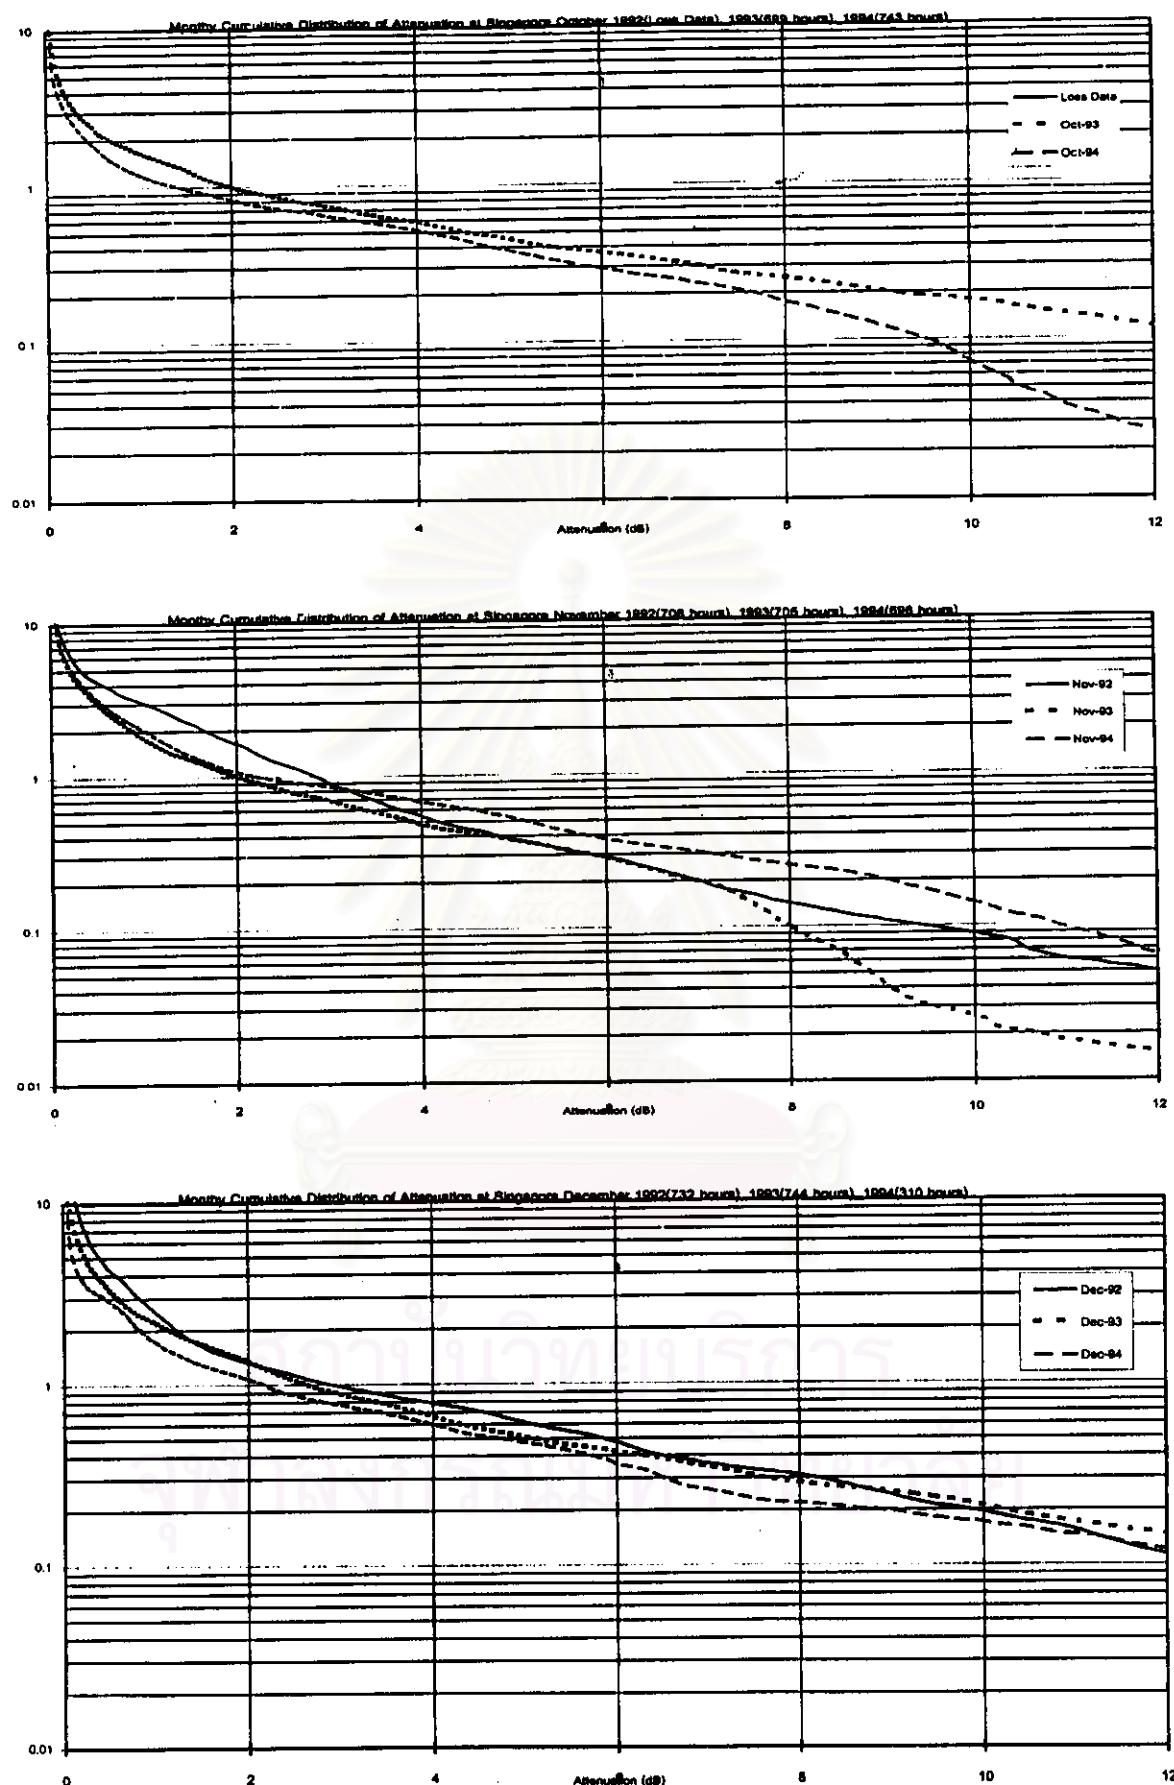

### 3. Singapore, Attenuation Distribution, 1/Mar/92- 28/Feb/95

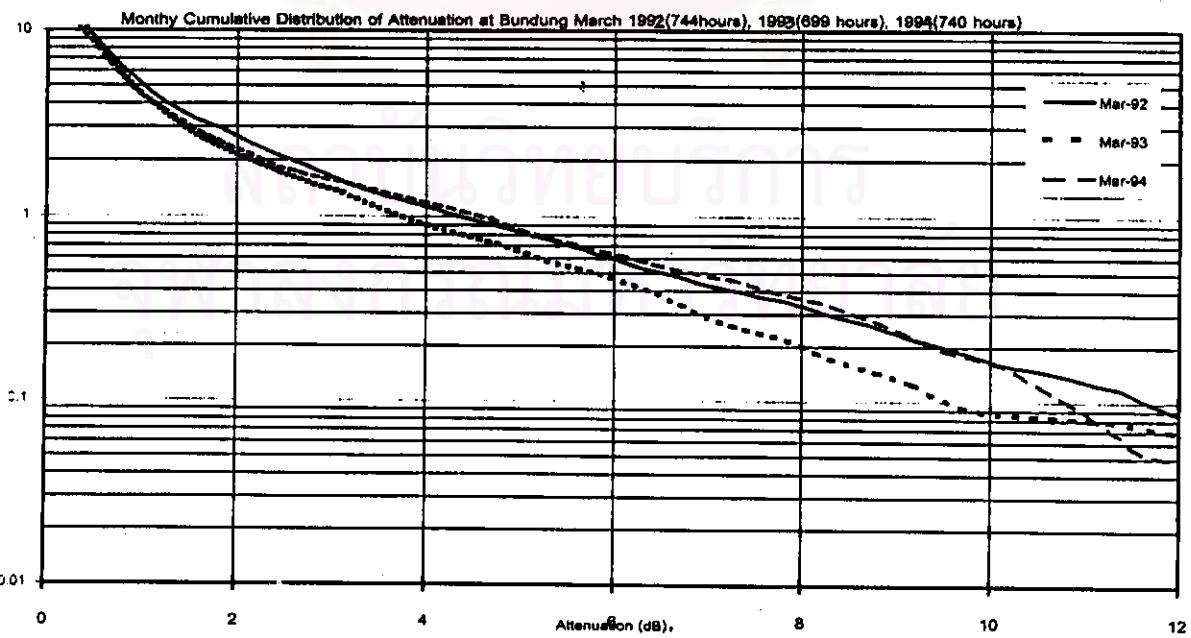

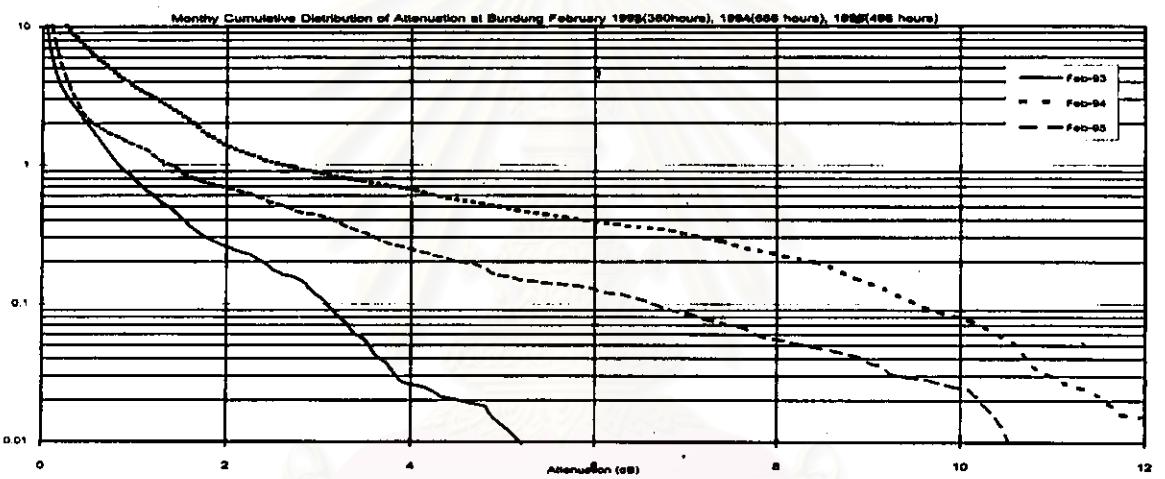

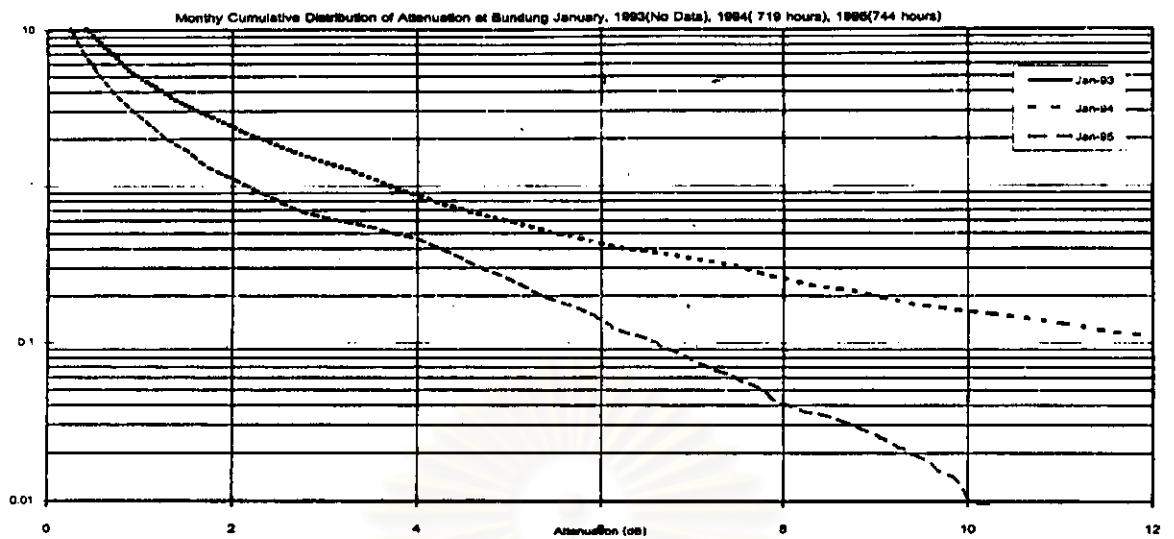

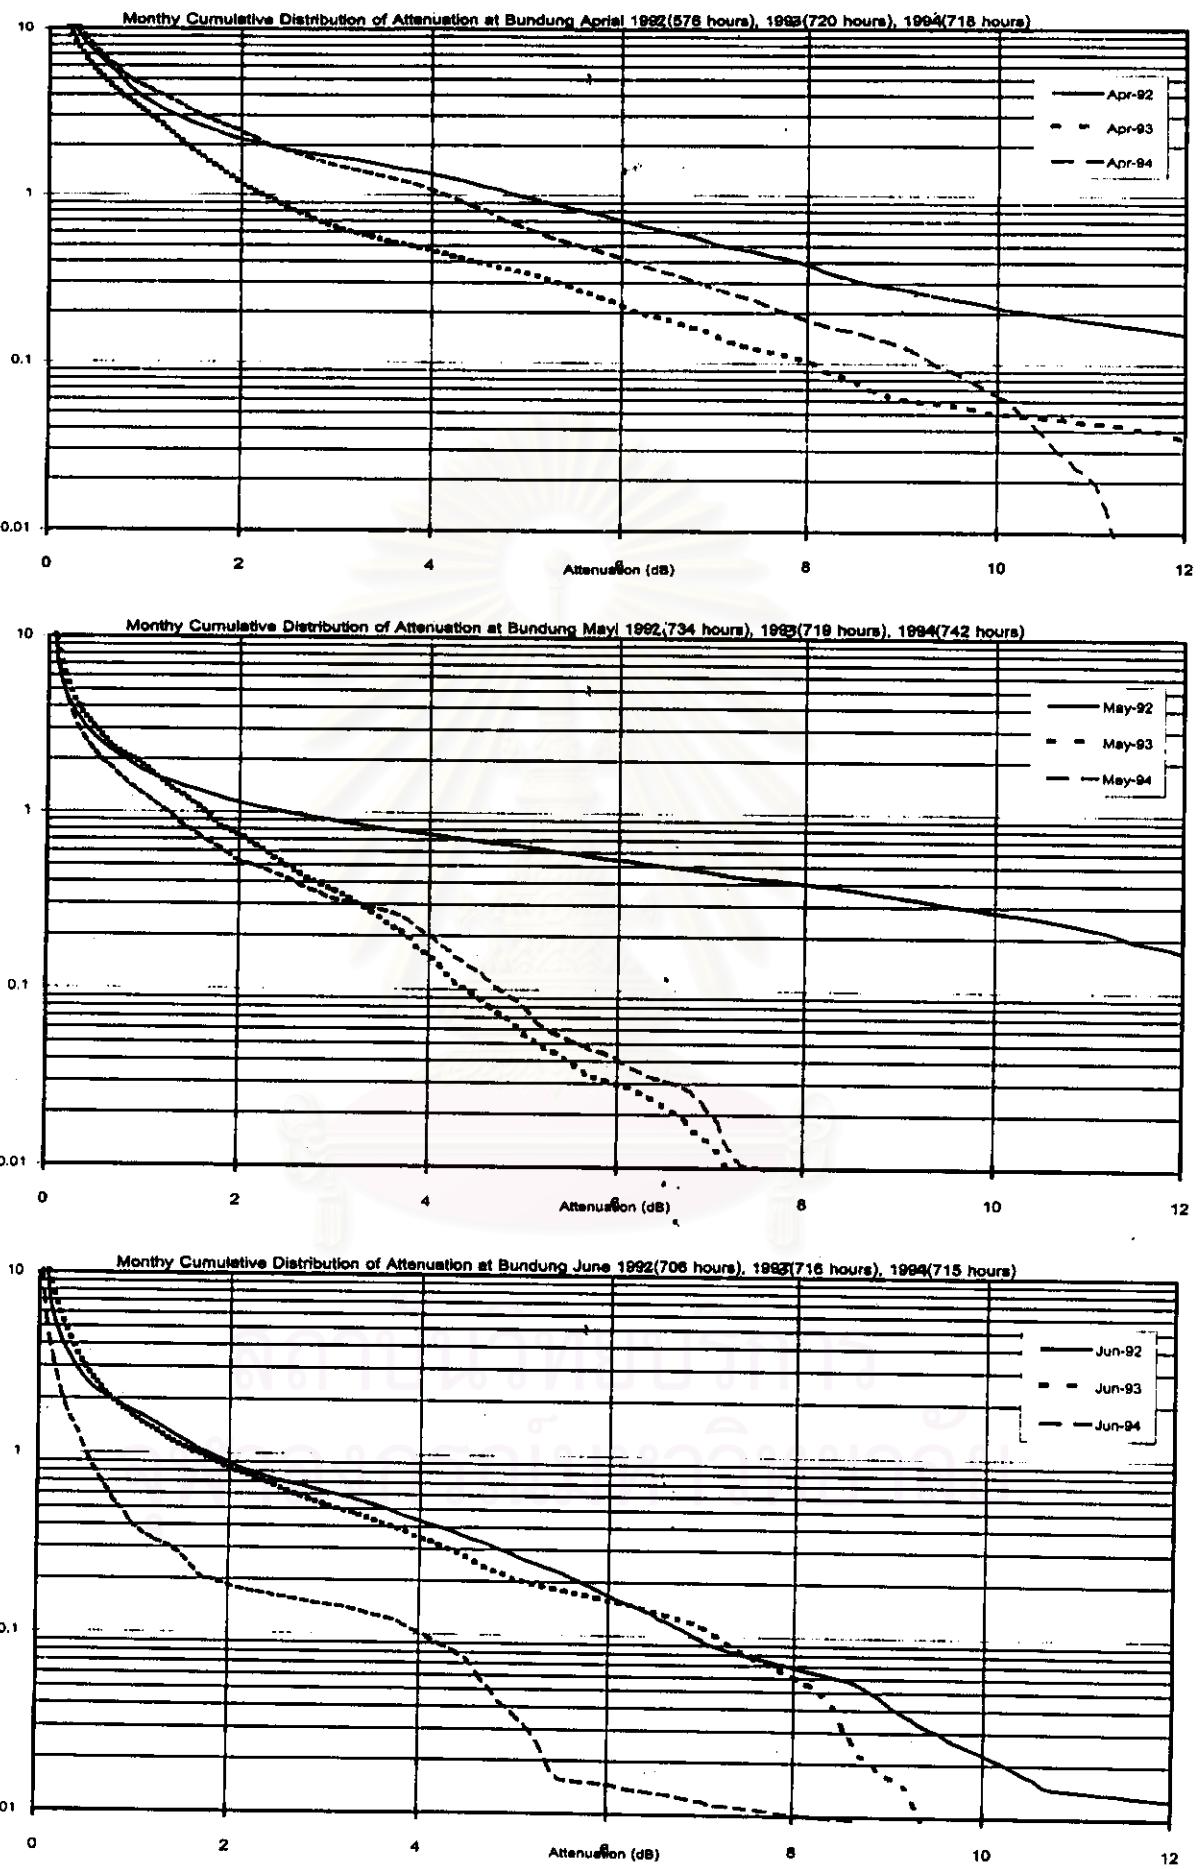

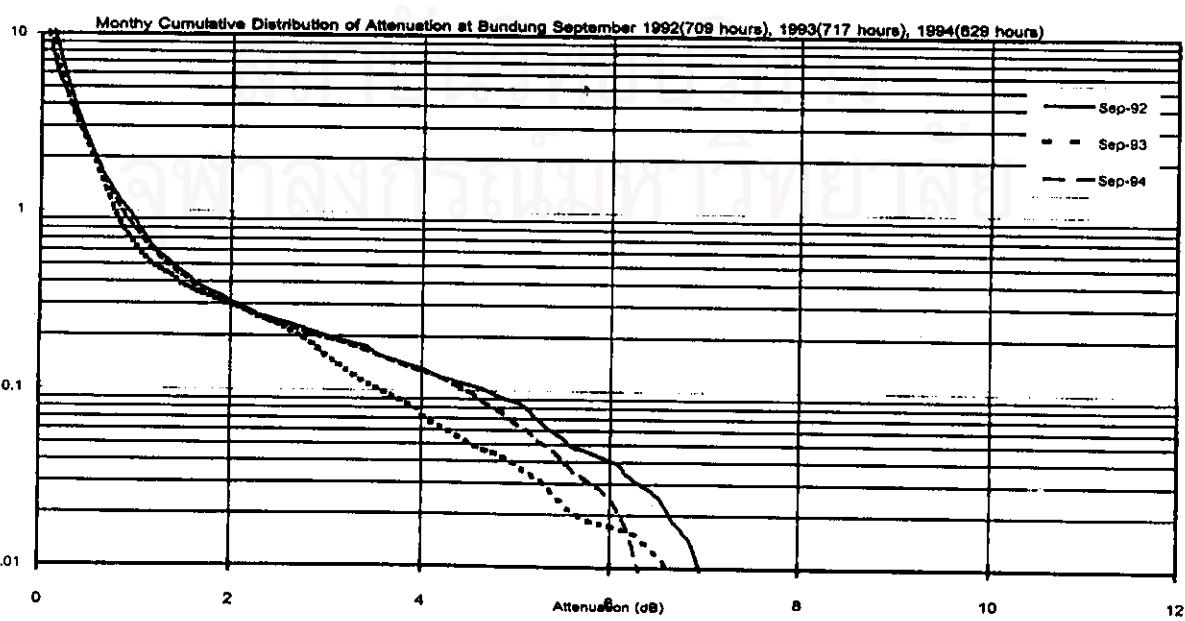

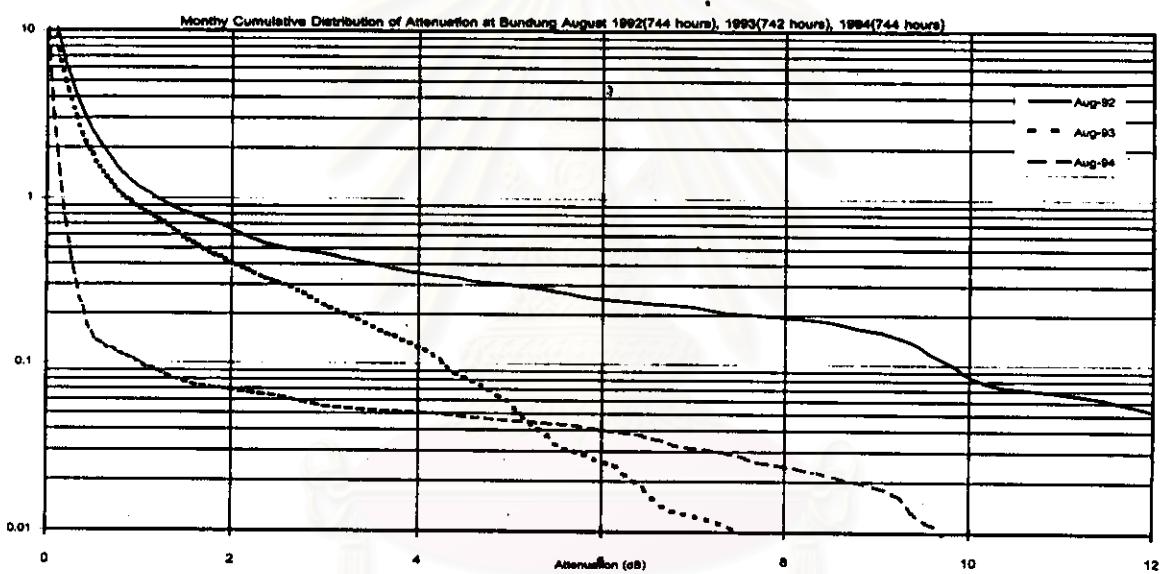

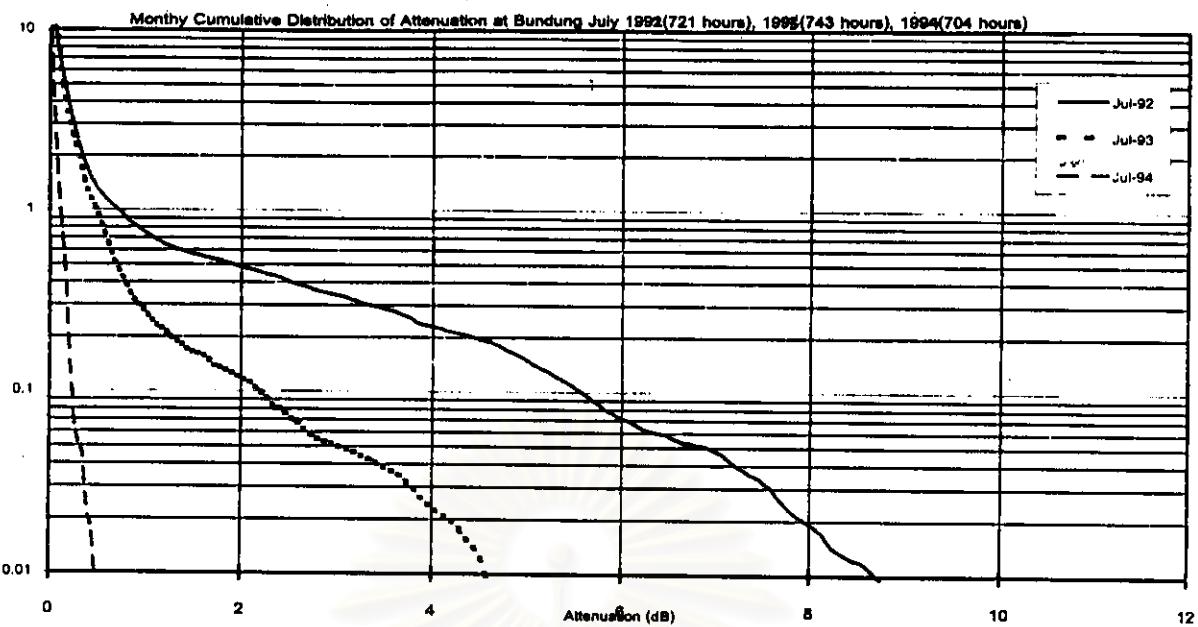

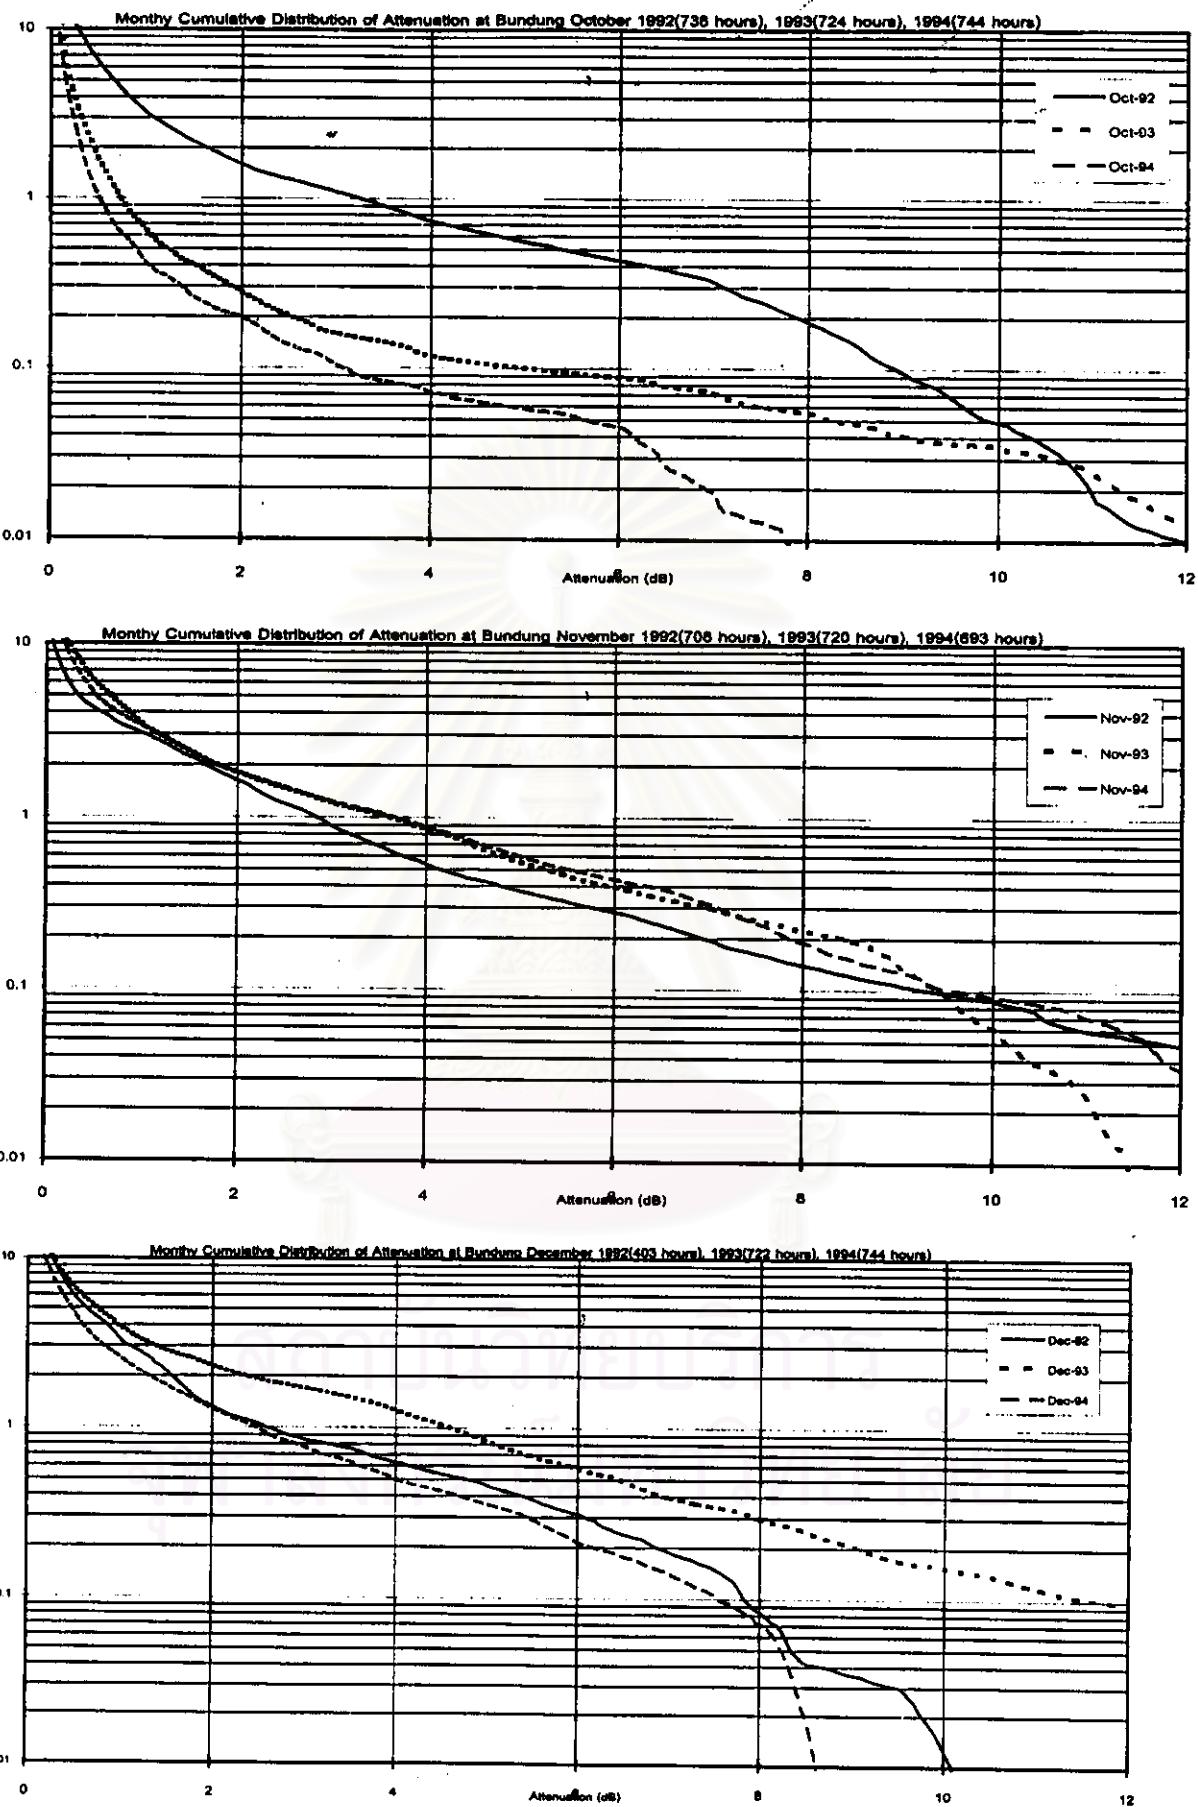

#### 4. Bundung; Attenuation Distribution, 1/Mar/92 - 28/Feb/95

Remark: The rows indicate the monthly names starting from March 1992 to February 1995. The columns show the measured rain attenuation exceeded the threshold at particular percentage time.

Table C-4. Cumulative Attenuation Distributions of Bandung

Remark: The rows indicate the monthly names starting from March 1992 to February 1995. The columns show the measured rain attenuation exceeded the threshold at particular percentage time.

## Estimation of Log-normal Distribution Parameters of Rain Attenuation Distribution

The fitted log-normal distribution of the measured rain attenuation is given in equation (5.3)

$$P(A \geq \alpha) = F(\alpha) \quad \text{--- (B1)}$$

$$= F(\ln(a)) \quad \text{--- (B2)}$$

$$= [1/(\sigma\sqrt{2\pi})] \int_{\ln(a)}^{\infty} \exp[-(x-m)^2/2\sigma^2] dx \quad \text{--- (B3)}$$

where  $m$  (mean) and  $\sigma$  (standard deviation) are unknown parameters that we need to find

$$P(A \geq \alpha) = Q((\ln(a) - m)/\sigma) \quad \text{--- (B4)}$$

$$= 1/2\pi \int_{((\ln(a) - m)/\sigma)}^{\infty} \exp(-x^2/2) dx \quad \text{--- (B5)}$$

so that

$$Q^{-1}(F(\alpha)) = (\ln(a) - m)/\sigma \quad \text{--- (B6)}$$

If the random variable "a" was log-normal, the linear relation can be expressed as:

$$Q^{-1}(F(\alpha)) = X \ln(a) + Y \quad \text{--- (B7)}$$

The slope  $X$  and intercept  $Y$  can be obtained by linear regression analysis of data pair.

Equation (B6) and (B7) are combined as:

$$(\ln(a) - m)/\sigma = X \ln(a) + Y \quad \text{--- (B8)}$$

From equation (B8), we can obtain the mean ( $m$ ) and standard deviation ( $\sigma$ ) from

$$m = -Y/X, \quad \sigma = 1/X \quad \text{--- (B9)}$$

Result of the parameters ( $m$ ,  $\sigma$ ) for the log-normal that is reasonable fit to the measured value in Bangkok, Si-racha, Singapore, and Bundung are shown below:

| Site Name | mean (dB) | Standard Deviation ( $\sigma$ ) |
|-----------|-----------|---------------------------------|
| Bangkok   | -3.7      | 2.2                             |
| Si-racha  | -3.7      | 2.15                            |
| Singapore | -4.2      | 2.2                             |
| Bundung   | -4.0      | 2.0                             |

## APPENDIX - D

### Diurnal Variation of 12 GHz Rain Attenuation in Thailand

Bangkok, 1/Mar/92 - 28/Feb/93 (Year -1) Available Data = 89%

## BIOGRAPHICAL NOTE

Mr. Rachan Lekkla was born in Ubonrajchathani province Thailand, on December 7, 1961. He received the B.Eng. degree in electrical engineering from Rajamongklala Institute of Technology, Bangkok, Thailand, in 1988. During 1989 -1991, he awarded a master degree scholarship from the Communications Authority of Thailand (CAT). In 1991, he receives the M.S. degree in electrical engineering from the George Washington University. After his graduation in 1991, he attained an internship program at INTELSAT (International Telecommunication Satellite Organization). From 1983 to the present time, he has been working with CAT, where he involves in the field of satellite communications over fourteen years.

During 1992 - 1995, he participated in "the Canada-ASEAN Cooperation in the Ku-band Propagation Measurement Program on Earth-Space part" as a researcher and project coordinator. He is currently working towards the Ph.D. degree in electrical engineering at the Chulalongkorn University, Bangkok, Thailand.

During his study, he contributes various research papers as follows:

- 1) R. Lekkla, P. Hettrakul. 1993. Ku-band Rain Attenuation Measurement in Thailand Proceedings, UN/Indonesia Regional Conference on space and technology for sustainable development, Bandung, Indonesia.
- 2) R. Lekkla, P. Prapinmongkolkarn, P. Hettrakul. 1993. Performance Analysis of Ku-band VSAT System in Thailand Proceeding APSITT'93 Symposium, Bangkok Thailand.
- 3) R. Lekkla, K.S. McCormick, J. Wascha, S.L. Lim. 1995. Rain Attenuation Measurement in Southeast Asia Proceeding of the 7<sup>th</sup> URSI Commission F Open Symposium, Ahmedabad, India.
- 4) R. Lekkla, P. Prapinmongkolkarn, P. Hettrakul, N. Yoothanorm. 1995. Site Diversity Measurement at Low elevation Angle in Thailand Seventh URSI Commission-F International Symposium on Wave Propagation and Remote Sensing, Ahmedabad, India.
- 5) R. Lekkla, P. Prapinmongkolkarn, P. Hettrakul, K.S. McCormick. 1995. Results of 1992-1994 Ku-band site diversity experiment at low elevation angle in Thailand Proceeding of 2<sup>nd</sup> Asia-Pacific Conference on Communications Osaka, Japan, pp. 720- 725.
- 6) Lekkla, P. Prapinmongkolkarn, K.S. McCormick. 1998. Analysis of Rain Intensity in SoutheastAsia Over 3-years Proceeding of Commission F Open Symposium on Climatic Parameters in Radio Wave Propagation Prediction, Ottawa, Canada. pp. 223-228.
- 7) R. Lekkla, K. S. McCormick, D.V. Rogers. 1998. 12 GHz Fade DurationStatistics on Earth Space Path in Southeast Asia, Proceeding of URSI Commission F Open Symposium on Climatic Parameters in Radiowave Propagation Prediction, Ottawa, Canada. pp.167-170.
