## Appendix B

### Calculation of limonin content in tangerine juice

Standard limonin equation :  $Y = 9.5466 * X$

Slope (S) = 9.5466

When Y represents to Peak area (mAu\*s) and

X represents to limonin concentration (ppm)

From HPLC analysis

Peak area of the limonin peak at 22 min = P

Thus limonin concentration of the extract =  $P/S$  ppm or  $\mu\text{g/ml}$

The 3 ml of extract was prepared from 3 ml of sample juice

Finally, limonin content in the sample juice =  $3*(P/S) \mu\text{g}$

## Appendix D

### 1. Capacity of $\beta$ -CD polymer in limonin adsorption for batch process at the optimum condition

Initial limonin content in juice load = 7.34 ppm

Juice load = 25 ml

Amount of  $\beta$ -CD polymer used = 0.75 g

Total limonin in 25 ml juice = 184  $\mu$ g

% limonin reduction of batch = 68 %

Thus Amount of limonin adsorbed by  $\beta$ -CD polymer =  $0.68 \times 184 = 125 \mu\text{g}$

Capacity of  $\beta$ -CD polymer in limonin reduction =  $125 / 0.75$

= 166  $\mu$ g limonin/g  $\beta$ -CD polymer

= 0.17 mg limonin/g  $\beta$ -CD polymer

### 2. Capacity of $\beta$ -CD polymer column in limonin adsorption at the optimum condition

Initial limonin content in juice load = 8.70 ppm

Juice load = 100 ml

Amount of  $\beta$ -CD polymer used = 3 g

Total limonin in 100 ml juice = 870  $\mu$ g

% limonin reduction of batch = 94 %

Thus Amount of limonin adsorbed by  $\beta$ -CD polymer =  $0.94 \times 870 = 818 \mu\text{g}$

Capacity of  $\beta$ -CD polymer in limonin reduction =  $818 / 3$

$$= 273 \mu\text{g limonin/g } \beta\text{-CD polymer}$$

$$= 0.27 \text{ mg limonin/g } \beta\text{-CD polymer}$$

### 3. Capacity of $\beta$ -CD polymer column in limonin adsorption at practical maximum load

Basis : 1 column operating at maximum load and the initial limonin content in juice was 10.11 ppm

#### Productivity of the laboratory scale

At maximum load, it produced 240 ml of debittered juice

Flow rate = 0.35 ml/minute

Process time for 240 ml load = 686 minutes or 11.43 hours / column

Productivity of laboratory scale (P) = 240 ml debittered juice / column / 1.43 hours

$$= 21 \text{ ml juice/column/hour}$$

#### Limonin adsorption capacity of the laboratory scale

$$= 10.11(\mu\text{g/ml juice}) \cdot 240 \text{ ml juice} / 3 \text{ g } \beta\text{-CD polymer}$$

$$= 808.8 \mu\text{g limonin /g } \beta\text{-CD polymer}$$

$$\approx 0.81 \text{ mg limonin /g } \beta\text{-CD polymer}$$

#### 4. Capacity of XAD-16 in limonin adsorption at the optimum condition

Initial limonin content in juice load = 10.11 ppm

Juice load = 100 ml

Amount of XAD-16 resin used = 5.6 g

Total limonin in 100 ml juice = 1011  $\mu$ g

% limonin reduction of batch ~ 100 %

Thus Amount of limonin adsorbed by XAD-16 resin =  $1 \times 1011 = 1011 \mu$ g

Capacity of  $\beta$ -CD polymer in limonin reduction =  $1011/5.6$

= 180.53  $\mu$ g limonin/ g XAD-16 resin

= 0.18 mg limonin/ g XAD-16 resin
