## Appendix B Calculation for Volume and Surface Resistivity

### Surface Resistivity

**Figure B1** Surface resistivity measurement technique.

$$\rho_s = K_s R$$

$\rho_s$  = surface resistivity (per square)

R = measured resistance in ohms (V/I)

$$K_s = P/g$$

where:

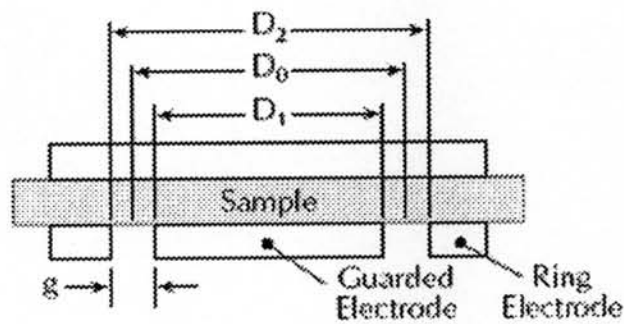

P = the effective perimeter of the guarded electrode (mm)

g = distance between the guarded electrode and the ring electrode (mm).

For circular electrodes:

$$P = \pi D_0$$

$$D_0 = D_1 + g$$

Test Fixture Dimensions (cm)	
Model 8009	
$D_1$	2.000 in
$D_0$	2.125 in
$D_2$	2.250 in
$g$	0.125 in

**Figure B2** Circular electrode dimensions.

### Volume Resistivity

**Figure B3** Volume resistivity measurement technique.

$$\rho_v = \frac{K_v}{\tau} R$$

$\rho_v$  = surface resistivity (per square)

$K_v$  = the effective area of the guarded electrode for the particular electrode arrangement employed

$\tau$  = average thickness of the sample (mm)

$R$  = measured resistance in ohms (V/I)

For circular electrodes:

$$K_v = \pi \left( \frac{D_1}{2} + B \frac{g}{2} \right)^2$$

$D_1$  = outside diameter of guarded electrode

$g$  = distance between the guarded electrode and the ring electrode

$B$  = effective area coefficient,  $B$  of 0 is typically used for volume resistivity
