

CHAPTER V

FIELD DATA COLLECTION

This chapter provides procedural guidelines for field data collection. Experimental results will be presented with details, involving 5 sections: Location Referencing Point (LRP) feature, Road Inventory, Road Condition, Bridge Inventory, and Bridge Condition. The system named Inspection Roadway Inventory System (IRIS) provides a touch-screen interface on a PDA (Personal Digital Assistant) to record the information of roadway inventory and conditions.

5.1 Field Data Collection

Mapping elements on roadway inventory was one of the objectives of this study as part of the field test of the digital data capture technique. The mapping practice was carried out in Road Number 13N in Lao PDR from Vientiane to Laungprabang province with the length about 400 kilometers. The initial intention was to carry out a set of road inventory element on the mapping. Elements on road mapping for roadway inventory were carried out to create a point feature as well as roads and bridges databases.

According to the methodology of Linear Location Referencing System (LRS), all of samples are recorded from Lao PDR (National Rd No 13N) and all selected links are recorded twice, one for road inventory and the other for road condition. The procedures are as follows:

- (1) Create point feature and setup the LRP and bridge maker on the based map. Input general attributes data for point feature and setup LRP symbology. In this research, two types of attributes data are recorded i.e. roadway inventory and other road element conditions.

- (2) Record the general road inventory attributes data such as road id, link id, segment id, surface types, number of lane, lane width, etc. along the roadway (1,000 meters/segment). In addition, if applicable, record bridge inventory and bridge condition data at the same time.
- (3) Record road condition attributes data such as pavement, side drain, culvert, slope, road furniture, and right of way (ROW). The score rating methodology is used to evaluate road element conditions along the roadway (200 meters/segment).
- (4) Capture the environment of road elements by digital camera.

For the above tasks, road inventory and road condition were recorded for a 10 km portion of the national road (Rd No 13N).

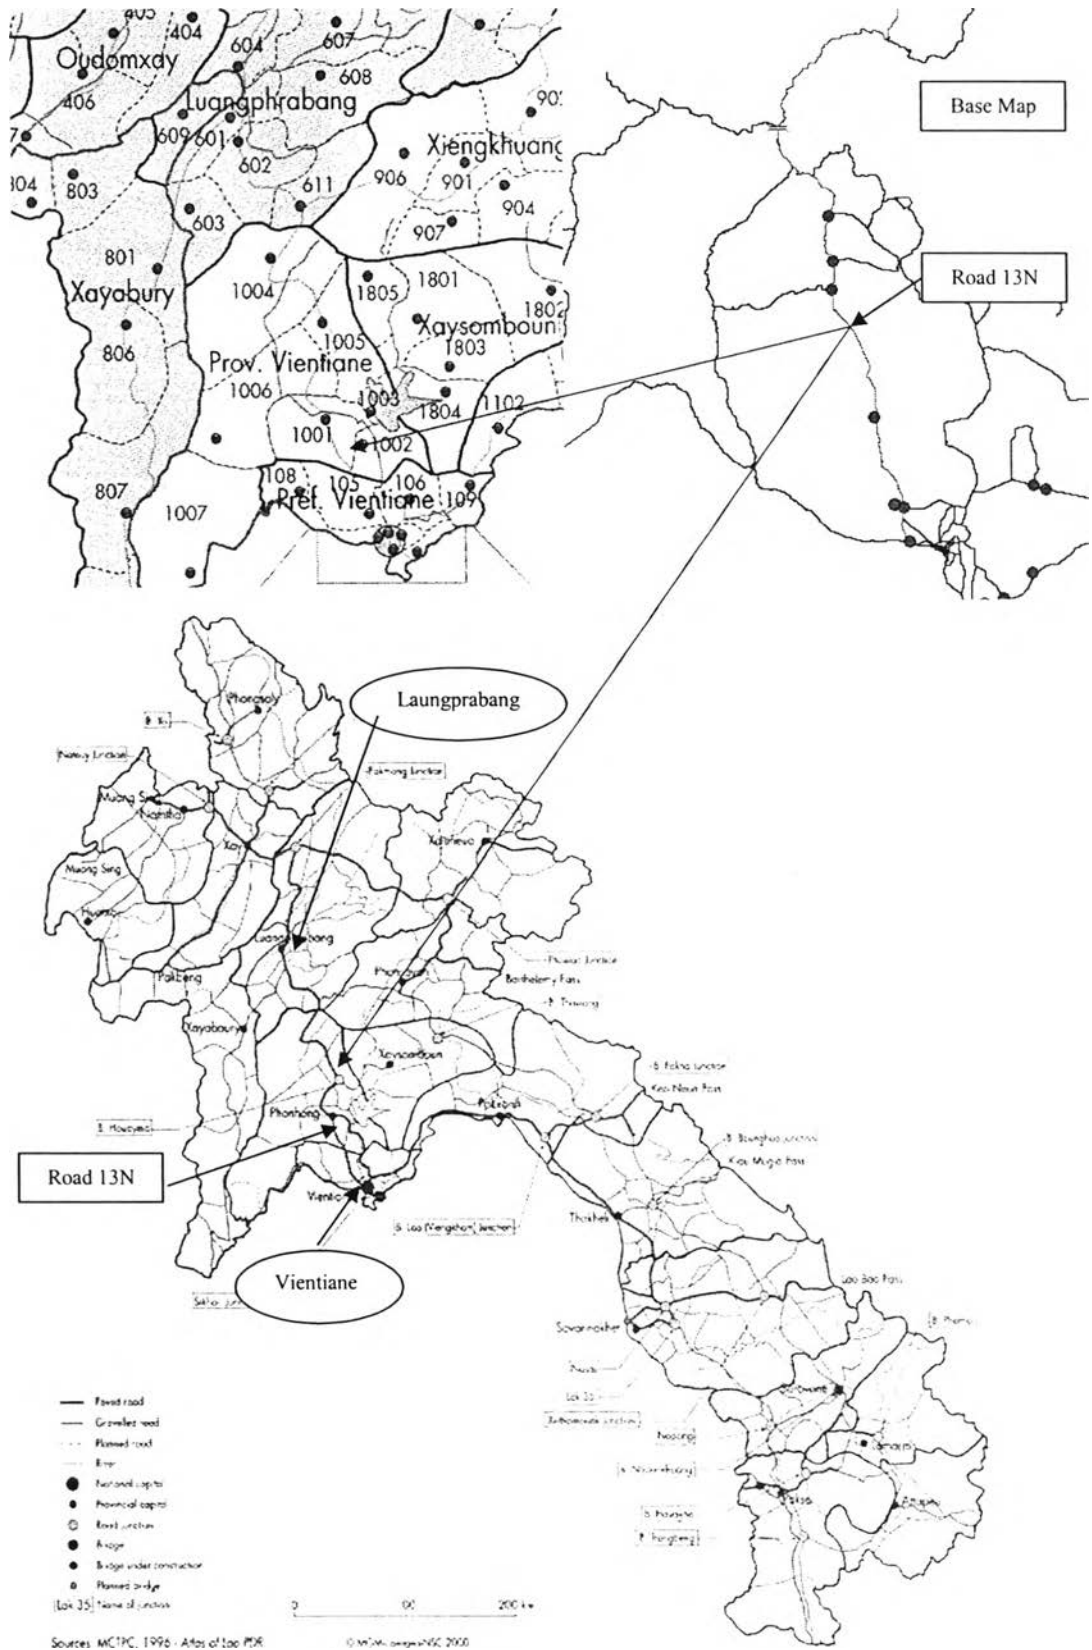

Figure 5.1 Location of Field Data Collection on Road No 13N in Lao PDR
 Source: http://www.seasite.niu.edu/Lao/Lao_maps/provinceslarge.htm

5.2 Data Collection Procedure

5.2.1 Before Data Collection

Procedures for data collection can be summarized as follows.

- (1) Before going to field location, all equipment must be checked. Make sure that they function properly for field data inspection.
- (2) Started ArcPad on the PDA. Two types of data collection are considered: road inventory and road condition.
- (3) Load Laos road inventory map layer, tap the Open Map icon, then choose the Laos road inventory map, tap add layer and add all layers that were created, choose the layer that is related to the data types being collected.
- (4) Connect GPS receiver to ArcPad. Tap GPS icon to receive the current position from the GPS receiver.
- (5) In this case, the road inventory in the Laos road inventory map was chosen. On the national road network, one segment is used for every 1,000 meters along the roadway.
- (6) Record by tapping the select icon and select the road segment on the map. Tap attribute icon and edit form will display information for the road inventory recorded.
- (7) An optional digital camera to capture the views of roadway inventories and their surrounding right-of-way environment.

5.2.2 Post Processing

- (1) After each day of data collection, data should be transferred to a computer

- (2) Files that need to be transferred from the ArcPad application folder on the PDA are: RoadInventory.dbf, RoadInventory.shp, and RoadInventory.shx. These files contain the road inventory attribute and location data collected.
- (3) Before returning to the field for a new data collection, a clean (with no data) set of the above three files must be copied to replace the same files in the ArcPad application folder.
- (4) At least one backup copy of all data collected should be made and stored in a separate location outside the office building that houses the computer.
- (5) If pictures are collected, they should be transferred to the same subfolder as that for RoadInventory.dbf, RoadInventory.shp, and RoadInventory.shx for a particular shift.
- (6) At the end of the data collection, data from all subfolders must be combined to create an integrated layer of road inventory and road condition for the whole road inventory system.

It is important to make sure that pictures in the subfolder are for the same road condition recorded in the three shapefiles in the subfolder. Accordingly, the inspector must decide whether to transfer both attribute files and picture files after each shift, not one or the other.

5.3 Data Collection Plan

5.3.1 Data Collection Time

- (1) Roadway inventories can be collected during the daylight hours on any day of the year.
- (2) Unless a water-proof PDA is used, data collection under rainy condition should be avoided.
- (3) Data collection on weekends generally offers the benefit of faster data collection and better safety.

- (4) Field data collection started from November, 24- 28, 2005 from Vientiane capital city to Laungprabang Province.

5.3.2 Mode of Travel

For safety during data collection, a van was used because it is considered to be the most convenience and comfortable mode of transportation for traveling from one segment to the next segment.

5.3.3 Initial Field Survey

Before the actual field data collection, it is important that an initial field survey (pilot survey) is conducted to obtain field condition and design the data collection plan that best suited to the study.

The Road No 13N in Lao PDR route was selected because of its varieties in roadway conditions. It was expected that these varying conditions would give an idea of the mobile inspection and installation characteristics for a variety of road environments.

5.4 Data Entry on the National Road (Rd No 13N)

5.4.1 Location Referencing Point

Location referencing points (LRP) are established based on route positions along the road, which can be found by surveyors (km posts, culverts, junctions, electric poles, temples, fuelling stations and bridges). LRPs should be identified to the accuracy of ± 2.5 meters or better.

5.4.2 Point Feature Data

The reference of point features can be intersection, end of segment, and post km on the left or right. The point feature symbology will be set on the base map. The point feature form will appear for inputting the attribute of the point feature into the page detail form. Table 5.1 presents the location referencing point data and Figures 5.2 to 5.3 illustrate the point feature and LRP setup forms, as well as the attributes and geographic forms.

Table 5.1 Location Referencing Point Data

- Y: 1989835.98400604
- Z: (empty)
- M: (empty)

Figure 5.3 Attributes and Geographic Forms

5.4.3 Road Inventory

Road Inventory data such as statistic data will be recorded at every 1,000 meters per segment. A registration can continue as long as the attribute does not change. When reaching a new LRP the registration is reset. The details of the road inventory are shown in the Table 5.2. Figures 5.4 through 5.7 shows examples of corresponding forms.

Table 5.2 Road Inventory Data

5.4.4 Road Condition

Road Condition data, such as road elements and pavement surface condition, is collected in terms of segments, typically 200 meter intervals. The detail of the road element and road condition survey is shown in Table 5.3.

5.4.5 Road Pavement Condition

Figures 5.8 through 5.12 illustrate examples of data input for road pavement conditions.

The figure shows two instances of the 'Road Condition' dialog box. The left instance is in the 'Survey' tab, displaying fields for RoadID (13N), LinkID (DA), SegmentID (0), Stat1 (6+200), Stat2 (6+400), LRP1 (1), LRP2 (2), RCSurveyID (1), and InspecDate (30/12/ 2442). The right instance is in the 'Road Element' tab, showing Inspector (RD) and a list of checked road element condition rating scores: Pavement, Road Furniture, Shoulder, Right of Way, Side Drain, Culvert, Stop, Accessibility Constrains, and Accessibility Level.

Figure 5.8 Survey and Road Elements Forms

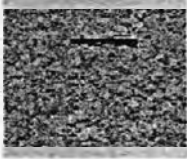

The figure shows two instances of the 'Road Condition' dialog box. The left instance is in the 'Flusing / Bleeding' tab, displaying a photo of a road surface and input fields for Length (258 mm), Depth (2 mm), Max Width (329 mm), and Area (8,4882 m.²). The right instance is in the 'Patching' tab, displaying a photo of a road surface and input fields for Length (15458 mm), Width (9754 mm), Max Width (9878 mm), and Area (138,4752 m.²).

The figure shows two side-by-side dialog boxes titled "Bridge".

The left dialog box has a tab labeled "Inventory" and a sub-tab "Bridge type". It contains the following fields:

- RoadID: 13N
- LinkID: DA
- SurveyID: 1
- Date: 7/1 / 2547
- Inspector: BRIDGE
- Bridge Number: 2
- BridgelD: 3
- Station start: 94+000

The right dialog box has a tab labeled "Bridge type" and a sub-tab "Dimensio". It contains the following fields:

- River name: NAM LIK
- Bridge name: NAM LIK
- Bridge type: Steel Truss, Bailey
- No. of Span: 0
- Bailey design: Double Single
- Wearing surface: Asphalt

Figure 5.17 General Information Bridge Forms

The figure shows two side-by-side dialog boxes titled "Bridge".

The left dialog box has a tab labeled "Dimension" and a sub-tab "Bridge ele". It contains the following fields:

- Width (m.): 6
- Length (m.): 200
- Min. span length (m.): 30
- Max. span length (m.): 40
- Max. load post (tons): 40
- Max. load assess (tons): 25
- Construction years: 1978
- Reconstructions years: 1978

The right dialog box has a tab labeled "Bridge element" and a sub-tab "Rema". It contains a list of elements with checkboxes:

- Bridge surface and footpath
- Parapets on bridge
- Guard Rails at Bridge Approach
- Drainage
- Piers
- Expansion Joints
- Bearings
- Superstructure
- River Bed
- Abuments
- Other
- Embankments

Figure 5.18 Dimension and Bridge Elements Forms

The figure shows two 'Bridge' dialog boxes. The left dialog, titled 'Bridge element', has a 'Bridge element' tab and contains a 'Donors' dropdown menu with 'Donor1' selected, a 'Remarks' text area with 'Condition of bridge is good', and a 'Photos path' text area with 'G:\My Documents\National Road 13'. The right dialog, titled 'Bridge Condition', has a 'Bridge Condition' tab and contains several fields: 'RoadID' (13N), 'LinkID' (DA), 'BridgelD' (3), 'Station start' (94+000), 'SurveyID' (1), 'Inspection date' (27/11/ 2548), 'Inspection name' (KHo), and 'Inspector' (bridge). Both dialogs have 'OK' and 'Cancel' buttons at the bottom.

Figure 5.19 Bridge Condition Forms

The figure shows two 'Bridge' dialog boxes. The left dialog has a 'Remarks' tab and contains fields for 'Temperature (°C)' (34), 'Weather' (Cold), 'Next inspection year' (2007), and a 'Remarks' text area with 'Concrete slope and T beam design'. The right dialog has a 'Bridge photos' tab and contains a photo of a road. Both dialogs have 'OK' and 'Cancel' buttons at the bottom.
