#### ABSTRACT

4791004063: Petrochemical Technology Program

Tarawipa Puangpetch: Organic Pollutant Degradation and Hydrogen Production Using SrTiO<sub>3</sub> Photocatalysts

Thesis Advisors: Prof. Sumaeth Chavadej, Prof. Susumu Yoshikawa, and Asst. Prof. Thammanoon Sreethawong, 160 pp.

Keywords:

SrTiO<sub>3</sub>/ Mesoporous Assembly/ Metal Loading/ Photocatalyst/
Pollutant Degradation/ Water Splitting/ Hydrogen Production

Pristine and metal-loaded mesoporous-assembled SrTiO<sub>3</sub> nanocrystal photocatalysts were successfully synthesized via the single-step sol-gel method with the aid of a structure-directing surfactant. The synthesis method provided the mesoporous-assembled SrTiO<sub>3</sub> nanocrystal photocatalysts with high purity, crystallinity, and homogeneity, as well as showed high reliability in photocatalyst reproduction. The synthesized photocatalysts were investigated their photocatalytic activity in both degradation of model organic pollutants and water splitting for hydrogen production with various hole scavengers. The results pointed out that the photocatalyst structure, in the form of a mesoporous assembly of SrTiO<sub>3</sub> nanocrystals, was found to be responsible for the enhancement of the photocatalytic activity of the SrTiO<sub>3</sub> photocatalysts. Some metals co-catalyst loading was found to enhance the photocatalytic hydrogen production activity of the mesoporousassembled SrTiO<sub>3</sub>-based photocatalyst. The enhancement in the photocatalytic hydrogen production activity depended on the electrochemical properties of the loaded metal type and the loading value. The 1 wt.% Au-loaded mesoporousassembled SrTiO<sub>3</sub> photocatalyst was found to be the most effective photocatalyst for the hydrogen production from the photocatalytic water splitting.

#### ACKNOWLEDGEMENTS

This thesis work is supported by a Project on Faculty Development in Shortage Area Scholarship (Thailand); Thailand Research Fund (TRF) and the Commission on Higher Education (Thailand); the Research Unit of Petrochemical and Environmental Catalysis, Chulalongkorn University (Thailand); the Sustainable Petroleum and Petrochemicals Research Unit, Center for Petroleum, Petrochemicals, and Advanced Materials, Chulalongkorn University (Thailand); and Institute of Advanced Energy, Kyoto University (Japan). This thesis work is partially funded by Postgraduate Education and Research Programs in Petroleum and Petrochemical Technology (PPT Consortium).

The author would like to express her sincere gratitude to Prof. Sumaeth Chavadej, Asst. Prof. Thammanoon Sreethawong, and Prof. Susumu Yoshikawa, her advisors, for their invaluable support, encouragement, supervision and useful suggestions throughout this research work. Their support and continuous guidance enabled the author to complete her work successfully.

She would like to express special thanks to Assoc. Prof. Sujitra Wongkasemjit, Assoc. Prof. Pramoch Rangsunvigit, and Dr. Singto Sakulkhaemaruethai for kindly serving on her thesis committee and their valuable suggestions throughout this study.

Her gratitude is absolutely extended to all staffs of the Petroleum and Petrochemical College, Chulalongkorn University, for all their kind assistance and cooperation and to her friends for their unforgettable friendship and support.

Furthermore, her sincere thanks go to her husband and sons, who shared their love and experiences with her.

Finally, she really would like to express her sincere gratitude to her parents for their love, understanding, and support throughout her life.

## LIST OF TABLES

| TABI | LE CONTRACTOR   | PAGE |
|------|---|------|
| 2.1  | Results of the SrTiO <sub>3</sub> -based photocatalysts for               |      |
|      | photocatalytic decomposition of water for hydrogen                        |      |
|      | production  | 33   |
| 2.2  | Results of the SrTiO <sub>3</sub> -based photocatalysts for               |      |
|      | photocatalytic decomposition of various pollutants                        | 34   |
| 4.1  | Thermal decomposition behaviors obtained from the TG-                     |      |
|      | DTA analysis of photocatalysts prepared by using different                |      |
|      | solvents  | 62   |
| 4.2  | Band gap wavelength $(\lambda_g)$ , the band gap energy $(E_g)$ ,         |      |
|      | and crystallite size of SrTiO <sub>3</sub> synthesized by using different |      |
|      | surfactants: LAHC, CTAB, and CTAC,  |      |
|      | commercial SrTiO <sub>3</sub> (Wako)                                      | 69   |
| 4.3  | Band gap wavelength $(\lambda_g)$ , the band gap energy $(E_g)$ ,         |      |
|      | and crystallite size of SrTiO <sub>3</sub> synthesized by using different |      |
|      | LAHC-to-TIPT molar ratios: 0.25:1, 0.5:1, 0.75:1, and 1:1,                |      |
|      | as compared to commercial SrTiO <sub>3</sub> (Wako)                       | 72   |
| 5.1  | Physical and textural properties of all investigated                      |      |
|      | photocatalysts  | 90   |
| 6.1  | Textural properties of all studied photocatalysts from XRF,               |      |
|      | XRD, UV-visible spectroscopy, and N <sub>2</sub> adsorption-              |      |
|      | desorption analyses   | 120  |
| 7.1  | Comparative results of specific H <sub>2</sub> production rate from the   |      |
|      | photocatalytic water splitting over various SrTiO <sub>3</sub> -based     |      |
|      | photocatalysts  | 149  |

### LIST OF FIGURES
