## APPENDICES

**APPENDIX A**

## Experiment for determining cause of Seat Abnormal Noise Failure

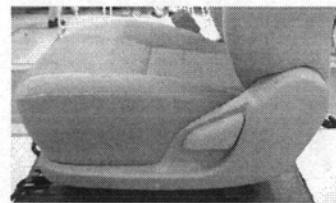

### Experiment

An experiment was conducted to collect information for analysis the root cause. The experiment was carried out according to the failure.

The total complaint from customer was 268 units since the product has been produced from September 2005 to January 2006. The noise couldn't detect in production process.

### Product

Automotive Front Seat (Model: 2004/V)

### Objective

The objective is to determine the best countermeasure for correct and preventive failure that will affect to customer satisfaction.

### Experiment and Measurement:

1. Confirm noise on bench test by vibration on horizontal and vertical direction with hand-manual, the result will show as in table below

Noise Standard Value	: 0 (db) / No noise
Sampling Check	: 30 Units
Period	: October (2005)
Suspect cause	: Noise inside bracket mechanism

Items Check	Trial # (N) (New Seat)	L/O Date (Production Date)	Noise	
			O.K (None)	N.G (Noise)
	1	8.30: (1-10-05)	O	
	2	13.00: (1-10-05)	O	
	3	8.30: (4-10-05)	O	
	4	13.00: (4-10-05)	O	
	5	8.30: (6-10-05)		O
	6	13.00: (6-10-05)	O	
	7	8.30: (8-10-05)	O	
	8	13.00: (8-10-05)	O	
	9	8.30: (11-10-05)		O
	10	13.00: (11-10-05)		O
	11	8.30: (13-10-05)	O	
	12	13.00: (13-10-05)	O	

Methods:

1. Hold seat on bench test
2. Hand check by vibrating seat on vertical and horizontal direction
3. No noise after confirmation

by manually.	13	8.30: (15-10-05)	O	
	14	13.00: (15-10-05)	O

	4	9.16 : (28-08-05)			O
	5	14.31: (5-09-05)			O
	6	10.21: (19-09-05)			O
	7	13.44 : (19-09-05)			O
	8	11.21 : (22-09-05)			O
	9	8.26 : (27-09-05)			O

#### **Seat Abnormal Noise Claims Confirmation**

### **Experiment Result and Analysis of Seat Abnormal Noise Failure**

The result of failure could summarize from experiment and measurement data. The criteria of problem came from the mechanism failure which could show in the table below. The complaint of customer still came to ABC Company continuously.

From 30 units of new seat in production, it could found noise defect 9 units which could summarize in percentage as 30% defect

<b>Defect 9 units from 30 units of New Seat in Production line (30 % defect)</b>				
<b>Defected on (New Seat)</b>	<b>L/O Date (Production Date)</b>	<b>Clearance Value</b>	<b>Result</b>	
			<b>O.K</b>	<b>N.G (Out)</b>
1	8.30: (6-10-05)	3.35		O
2	8.30: (11-10-05)	3.38		O
3	13.00: (11-10-05)	3.29		O
4	8.30: (18-10-05)	3.35		O
5	13.00: (20-10-05)	3.40		O
6	8.30: (25-10-05)	3.37		O
7	13.00: (26-10-05)	3.36		O
8	8.30: (27-10-05)	3.39		O
9	8.30: (29-10-05)	3.37		O

### **Result Seat Defect Units from Experiment**

It could obviously see that the clearance value after measurement was totally out of standard.

### Experiment for determining cause of Seat Sliding Failure

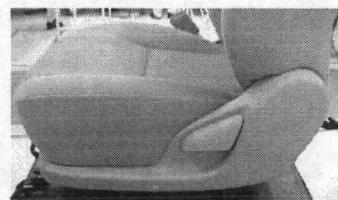

#### Experiment

An experiment was conducted to collect information for analysis the root cause. The experiment was carried out according to the failure.

The total complaint from customer was 91 units since the product has been produced from September 2005 to January 2006.

#### Product

Automotive Front Seat (Model: 2004/V)

#### Objective

The objective is to determine the best countermeasure for correct and preventive failure that will affect to customer satisfaction.

#### Experiment and Measurement:

1. Confirm bracket sliding component hardness on bench test. Use push pull gauge to measure harness value of seat sliding component

Pull Scale Std Value : 40 Kgf (No looseness)

Sampling Check : 2 units / shift

Period : November - December (2005)

Suspect cause : Poor material hardness

Items Check	Trial # (N) (New Seat)	L/O Date (Production Date)	Pull Scale Value (Kgf)	Result	
				O.K	N.G (Out)
	1	8.30: (2-11-05)	4.0	O	
	2	13.00: (2-11-05)	4.0	O	
	3	8.30: (3-11-05)	4.0	O	
	4	13.00: (3-11-05)	4.0	O	
	5	8.30: (4-11-05)	4.0	O	
	6	13.00: (4-11-05)	4.0	O	
	7	8.30: (7-11-05)	4.0	O	
	8	13.00: (7-11-05)	4.0	O	
	9	8.30: (8-11-05)	4.0	O	
	10	13.00: (8-11-05)	4.0	O	
	11	8.30: (9-11-05)	4.0	O	
	12	13.00: (9-11-05)	4.0	O	
	13	8.30: (10-11-05)	4.0	O	

Methods:  
 1. Hold seat on part holder  
 2. Use push pull gauge to confirm hardness value.  
 3. No looseness after 40 kgf.

**Seat Sliding Failure Claims Confirmation**

**Experiment Result and Analysis of Seat Sliding Failure**

The result of failure could summarize from experiment and measurement data. The criteria of problem came from sliding groove width failure which could show in the table below. The complaint of customer still came to ABC Company continuously.

From 50 units of new seat in production, it could found noise defect 4 units which could summarize in percentage as 8% defect

Defect 4 units from 50 units of New Seat in Production line (8 % defect)				
Defected on (New Seat)	L/O Date (Production Date)	Clearance Value	Result	
			O.K	N.G (Out)
1	8.30: (9-11-05)	9.36		O
2	8.30: (21-11-05)	9.27		O
3	13.00: (24-11-05)	9.29		O
4	13.00: (1-12-05)	9.34		O

**Result Seat Defect Units from Experiment**

It could obviously see that the sliding groove width value after measurement was totally out of standard.

## **Experiment for determining cause of Part Seat Dirty**

### **Experiment**

An experiment was conducted to collect information for analysis the root cause. The experiment was carried out according to the failure.

The total complaint from customer was 53 units since the product has been produced from September 2005 to January 2006.

### **Product**

Automotive Front Seat (Model: 2004/V)

### **Objective**

The objective is to determine the best countermeasure for correct and preventive failure that will affect customer satisfaction.

### **Experiment and Measurement:**

1. Confirm seat dirty in final inspection process.

Standard : Visual inspection with no dirt

Sampling Check : 100% (All units)

Period : November - December (2005)

Suspect cause : Operator

### **Seat Dirty Confirmation on Deliver Pallet**

#### **Experiment Result and Analysis of Part Seat Dirty**

The result of failure couldn't identify and summarize from experiment and measurement data. The criteria of problem still unclear failure and couldn't explain. The complaint of customer still came to ABC Company continuously.

From 50 units of new seat in production, it couldn't found abnormal dirty on part seat. The part was clean and no dirt or mark on itself.

#### **Experiment for determining cause of Part Seat Dirty #1**

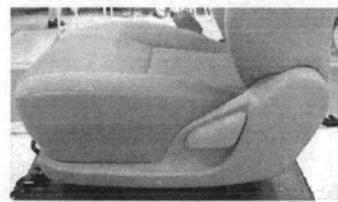

##### **Experiment**

A second experiment was conducted to collect information for analysis the root cause after first experiment failed. The experiment was carried out according to the failure.

The total complaint from customer was 53 units since the product has been produced from September 2005 to January 2006.

**Product**

Automotive Front Seat (Model: 2004/V)

#### **Seat Dirty Confirmation on Part Stock Area**

### **Experiment Result and Analysis of Part Seat Dirty #2**

After reconfirm part seat dirty problem, the result of failure could identify and summarize from experiment and measurement data. The criteria of problem came from part stocking process and possible to occur in every time when operator has touched part by unintentionally to moving pallet. The complaint of customer still came to ABC Company continuously.

From 50 units of new seat in production, it could found abnormal dirty on part seat 3 units which could summarize in percentage as 6% defect.

<b>Defect 3 units from 50 units of New Seat in Stocking Process (6% defect)</b>			
<b>Defected on (New Seat)</b>	<b>Result</b>		<b>Remark</b>
	<b>O.K</b>	<b>N.G (Dirt /Mark)</b>	
1		O	Dirty on cushion
2		O	Dirty on cushion
3		O	Dirty on cushion

### **Result Seat Defect Units from Experiment #2**

---

**APPENDIX B**

### **Severity (S)**

Severity of this problem has been ranked in associated with the most serious effect for a given failure mode. The severity of this case is a relative ranking within the scope of the individual FMEA. A reduction in severity ranking index can be effected through a design change system, subsystem or component or a redesign of the process. According to the problem of “seat abnormal noise”, if the customer affected by a failure mode is the manufacturing or assembly plant or the product user, assessing the severity may lie outside the immediate process engineer’s / teams

**Table A: Suggested FMEA Severity Evaluation Criteria**

<b>Effect</b>	<b>Criteria: Severity of Effect This ranking results When a potential failure mode results in a final customer and/or a manufacturing assembly plant defect. The final customer should always be considered first. If both occur, use the higher of the two severities. (Customer Effect)</b>	<b>Criteria: Severity of Effect This ranking results when a final customer and/or a manufacturing/assembly plant defect. The final customer should always be considered first of the higher of the two severities. (Manufacturing/ Assembly Effect)</b>	<b>Ranking</b>
Hazardous without warning	Very high severity ranking when a potential failure mode affects safe vehicle operation and/or involves noncompliance with government regulation with warning.	Or may endanger operator (machine or assembly) without warning	10
Hazardous with warning	Very high severity ranking when a potential failure mode affects safe vehicle operation and/or involves noncompliance with government	Or may endanger operator (machine or assembly) without warning	9

	regulation with warning.		
Very High	Vehicle/item inoperable (loss of primary functioned).	Or 100% of product may have to be scrapped, or vehicle/item repaired in repair department with a repair time greater than one hour.	8
High	Vehicle/item operable but at a reduced level of performance. Customer dissatisfied	Or product may have to be sorted and a portion (less than 100%) scrapped, or vehicle/item repaired in repair department with a repair time between a half-hour and an hour.	7
Moderate	Vehicle / item operable but Comfort/Convenience item(s) inoperable. Customer dissatisfied.	Or a portion (less than 100%) of the product may have to be scrapped in repair department with a repair department with a less than a half-hour.	6
Low	Vehicle/ Item operable but comfort/convenience item(s) operable at a reduced level of performance	Or 100% of product may have to be reworked or vehicle/item repaired off-line but does not go to repair department	5
Very Low	Fit and Finish/Squeak and Rattle item does not conform. Defect noticed by most customers (greater than 75%)	Or the product may have to be sorted, with no scrap, and a portion (less than 100%) reworked	4
Minor	Fit and Finish/Squeak and Rattle item does not conform. Defect noticed by 50% of customers	Or a portion (less than 100%) of the product may have to be reworked with no scrap, on-line but out-of-standard.	3
Very Minor	Fit and Finish/Squeak and Rattle item does not conform. Defect noticed by discriminating customers (less than 25%)	Or a portion (less than 100%) of the product may have to be reworked with no scrap, on-line but in - station	2
None	No discernible effect	Or slight inconvenience to operation or operator, or no effect.	1

### **Occurrence (O)**

Occurrence is the likelihood that a specific cause / mechanism of failure will occur. For this problem, likelihood of occurrence ranking number has a relative meaning rather than an absolute value. Preventing or controlling the causes/mechanisms of failure of seat through a design or process change is the only way a reduction in the occurrence ranking can be effected.

Estimated the likelihood of occurrence of potential failure causes/mechanism on a 1 to 10 scale

**Table B: Suggested FMEA Occurrence Evaluation Criteria**

Probability	Likely Failure Rates	Ranking
Very High : Persistent Failures	$\geq 100$ per thousand pieces	10
	50 per thousand pieces	9
High Frequent Failures	20 per thousand pieces	8
	10 per thousand pieces	7
Moderate: Occasional Failures	5 per thousand pieces	6
	2 per thousand pieces	5
	1 per thousand pieces	4
Low: Relatively Few Failures	0.5 per thousand pieces	3
	0.1 per thousand pieces	2
Remote: Failure is unlikely	$\leq 0.01$ per thousand pieces	1

### Detection (D)

Detection is the rank associated with the best detection control listed in the process control column. Detection is a relative ranking within the scope of the individual FMEA. In order to achieve a lower ranking, generally the planned process control has to be improved.

**Table C: Suggested FMEA Detection Evaluation Criteria**

<b>Detection</b>	<b>Criteria</b>	<b>Inspection Types</b>			<b>Suggested Range of Detection Methods</b>	<b>Ranking</b>
		<b>A</b>	<b>B</b>	<b>C</b>		
Almost impossible	Absolute certainty of non detection			X	Cannot detect or is not checked	10
Very Remote	Controls will probably not detect			X	Control is achieved with indirect or random checks only	9
Remote	Controls have poor chance of detection			X	Control is achieved with visual inspection only	8
Very Low	Controls have poor chance of detection			X	Control is achieved with double inspection only	7
Low	Controls may detect		X	X	Control is achieved with charting methods, such as SPC (Statistic Process Control)	6
Moderate	Controls may detect		X		Control is based on variable gauging after parts have left the station, or Go/No Go gauging performed on 100% of the parts after parts have left the station	5
Moderately High	Controls have a good chance to detect	X	X		Error detection in subsequently operations, or gauging performed on setup and first-piece check (for set-up causes only)	4
High	Controls have a good chance to detect	X	X		Error detection in-station, or error detection in subsequent operations by multiple layers of acceptance: supply, select, install,	3

					verify. Cannot accept discrepant part.	
Very High	Controls almost certain to detect	X	X		Error detection in- station (automatic gauging with automatic stop feature). Cannot pass discrepant part.	2
Very High	Controls certain to detect	X			Discrepant parts cannot be made because item has been error-proofed by process/product design	1

## BIOGRAPHY

M.r Piyanut Kumaddee was born in 1980 in Bangkok, Thailand. He obtained his bachelor's degree in mechanical engineering from Thammasat University in 2002. After graduation, he started working as quality assurance engineer at Carrier Toyota Motor Company (Thailand) for 3 years. During that, he decided to study for Master of Engineering and Master of Science in Engineering Management jointly offered by Chulalongkorn University and The University of Warwick at the Regional Centre for Manufacturing Systems Engineering. He enrolled as a part-time student and graduated in academic year 2005.
