Khine Yi Mya: Physical and Rheological Properties of Nonionic Polymers - Ionic Surfactants Complexes.

Thesis Advisors: Prof. Alexander M. Jamieson and Assoc. Prof.

Anuvat Sirivat, 376 pp. ISBN 974-03-1553-4

Keywords : Polyethylene oxide/ PEO/ Hexadecyltrimethylammonium chloride/ HTAC/ Hydroxypropyl cellulose/ HPC/ Cocamidopropyl dimethyl glycine/ CADG/ Conductivity/ Viscosity/ Dynamic light scattering/ DLS/ Static light scattering/ SLS/ Refractive index increment/ Dialysis equilibrium

The formation of a polymer-surfactant complex upon mixing a nonionic polymer, poly(ethylene oxide) (PEO), with a cationic surfactant, hexadecyltrimethylammonium chloride (HTAC), was studied by observing the changes in conductivity, specific viscosity (η_{sp}), and hydrodynamic radius (R_h). The conductivity data showed that an interaction between PEO and HTAC occurred at a temperature above 25°C, as indicated by a decrease in the critical aggregation concentration in the presence of PEO relative to the critical micelle concentration of a surfactant in the absence of PEO. The binding of HTAC to PEO induced a chain expansion due to electrostatic repulsions between bound micelles. On further addition of HTAC, η_{sp} and R_h reached a maximum at the saturation of binding, and then decreased because of the contraction of the PEO-HTAC complex due to electrostatic screening from the accumulation of free micelles and counterions in the solution.

From the static light scattering, the structures of PEO-HTAC complexes were determined by means of molecular weight measurement at different concentration ratios of HTAC to PEO. Multichain complexation was observed in aqueous solution in the formation of the complex at the maximum binding. However, in the presence of 0.1 M KNO_3 , the structure of the complex changed from

multichain to unipolymer complexation. Moreover, the number of bound HTAC molecules per PEO chain increased from 0.12 mole HTAC per mole EO to 0.23 mole HTAC per mole EO in salt solution.

Rheological measurements also indicated that the storage modulus G' and the loss modulus G'' of the concentrated PEO-HTAC complex solution show largest values at mass concentration ratio of 1.5, which is near the maximum binding of HTAC to PEO in dilute aqueous solution. It was confirmed that the progressive increase on the PEO-HTAC aggregates induced a cross-linking between PEO and HTAC, leading to an increase in the modulus.

Finally, the interaction between nonionic polymer, hydroxypropyl cellulose (HPC), and amphoteric surfactant, cocamidopropyl dimethyl glycine (CADG), was studied by means of viscosity and light scattering measurements in an isoelectric point ($\text{pH} = 9$). The viscosity and dynamic light scattering showed that a maximum and a minimum occurred $[\text{HTAC}]/[\text{PEO}]$ ratios (c_s/c_p) at 0.026 and 0.43. From Zimm plot analysis, the molecular weight of complex ($M_{w,\text{com}}$) was approximately equal to the molecular weight of pure HPC at maximum point, indicating that there was no interaction between HPC and CADG at $c_s/c_p = 0.026$. The increases in $M_{w,\text{com}}$ and the number of bound CADG to HPC were observed due to the binding between polymer and surfactant. At the binding condition, the minimum value was observed because of the electrostatic attractions between positive and negative charges within the polymer chain.

บทคัดย่อ

คายน์ ยี เมีย : สมบัติทางกายภาพและสภาพการไหลของสารประกอบร่วมของพอลิเมอร์ชนิดไร้ประจุและสารลดแรงตึงผิวประเภทมีประจุ (Physical and Rheological Properties of Nonionic Polymers – Ionic Surfactants Complexes) อ.ที่ปรึกษา : ศ.ดร. อเล็กซานเดอร์ เอ็ม เจมีสัน และ รศ.ดร. อนุวัฒน์ ศิริวัฒน์ 376 หน้า ISBN 974-03-1553-4

การก่อตัวของสารประกอบร่วมพอลิเมอร์และสารลดแรงตึงผิว โดยการรวมกันระหว่างพอลิเมอร์ประเภทไร้ประจุ พอลิเอธิลีนออกไซด์ (PEO) กับสารลดแรงตึงผิวประเภทประจุบวก เฮกซะเดคซิลไตรเมทิลแอมโมเนียมคลอไรด์ (HTAC) ได้มีการศึกษาโดยการสังเกตการเปลี่ยนแปลง ค่าการนำไฟฟ้า ค่าความหนืดจำเพาะ (η_{sp}) และค่ารัศมีไฮโดรไดนามิก (R_h) ข้อมูลการนำไฟฟ้าแสดงให้เห็นว่าการทำปฏิกิริยาต่อกันระหว่าง PEO และ HTAC เกิดขึ้นที่อุณหภูมิสูงกว่า 25 องศาเซลเซียสขึ้นไป ซึ่งเห็นได้จากการลดลงของค่าความเข้มข้นวิกฤตของการรวมตัวในระบบที่มี PEO เทียบกับค่าความเข้มข้นวิกฤตของการเกิดไมเซลล์ของสารลดแรงตึงผิว ในระบบที่ไม่มี PEO การรวมตัวกันของ HTAC และ PEO ทำให้สายของพอลิเมอร์ขยาย เนื่องจากแรงผลัทางไฟฟ้าสถิตย์ระหว่างพันธะในไมเซลล์ เมื่อเพิ่มปริมาณของ HTAC ค่า η_{sp} และ R_h จะขึ้นไปสู่ค่าสูงสุดที่สภาวะอิมในการรวมตัว หลังจากนั้นจะลดลง เนื่องจากการหดตัวของสารประกอบร่วม PEO และ HTAC ซึ่งเกิดจากการบดบังทางไฟฟ้าสถิตย์จากการรวมตัวกันของไมเซลล์อิสระ และประจุไฟฟ้าตรงข้ามในสารละลาย

จากการศึกษาด้านกระเจิงแสงสถิตย์ โครงสร้างของสารประกอบร่วม PEO-HTAC ได้มีการศึกษาในเรื่องของ การวัดขนาดมวลโมเลกุล ที่อัตราส่วนความเข้มข้นของ HTAC ต่อ PEO ที่แตกต่างกัน การเกิดสารประกอบร่วมแบบหลายโซ่พบได้ในสารละลายที่มีน้ำเป็นตัวทำละลาย ในสภาวะที่เกิดการรวมตัวสูงสุด อย่างไรก็ตาม ภายหลังจากการเติม KNO_3 1 โมล โครงสร้างของสารประกอบร่วมมีการเปลี่ยนแปลงจากรูปร่างหลายโซ่ไปเป็นสารประกอบร่วมสายโซ่เดี่ยว ยิ่งไปกว่านั้น จำนวนของพันธะระหว่างโมเลกุล HTAC ต่อ PEO มีค่าเพิ่มขึ้นจาก 0.12 โมล HTAC ต่อ 1 โมล PEO ไปเป็น 0.23 โมล HTAC ต่อ 1 โมล PEO ในสารละลายเกลือ

การวัดค่าสภาพการไหลยังแสดงให้เห็นว่า ค่ามอดูลัสความเป็นของแข็ง (G') และค่ามอดูลัสความเป็นของเหลว (G'') ของสารละลายเข้มข้น PEO-HTAC มีค่าสูงสุดเมื่ออัตราส่วนความเข้มข้น

โดยมวลเป็น 1.5 ซึ่งใกล้เคียงกับค่าสูงสุดในการรวมตัวกันของ HTAC และ PEO ในสารละลายเจือจาง การทดลองนี้ได้รับการยืนยันว่า การเพิ่มขึ้นของการรวมตัวกันระหว่าง PEO และ HTAC ทำให้เกิดพันธะร่วมกันระหว่าง PEO และ HTAC และนำมาสู่การเพิ่มขึ้นของค่ามอดูลัส

ปฏิกิริยาสัมพันธกันระหว่างพอลิเมอร์ไรรีประจุ ไฮดรอกซีโพรพิลเซลลูโลส (HPC) และสารลดแรงตึงผิวประเภทประจุคู่ โคคามิโดรโพรพิลโดเมธิลไกลซีน (CADG) ได้รับการศึกษาจากค่าความหนืดและจากการวัดค่าการกระเจิงแสงที่จุดไอโซอิเล็กทริก ($pH=9$) ค่าความหนืด และค่าการกระเจิงแสงไดนามิก แสดงให้เห็นว่า ค่ามากที่สุด และค่าน้อยที่สุด จะเกิดขึ้นเมื่ออัตราส่วนของ HTAC ต่อ PEO อยู่ที่ 0.026 และ 0.43 จากการวิเคราะห์โดยซิมพลอต ค่ามวลโมเลกุลของสารประกอบรวม ($M_{w,com}$) จะมีค่าโดยประมาณเทียบเท่ากับค่า มวลโมเลกุลของ HPC ที่จุดสูงสุด ซึ่งแสดงให้เห็นว่าไม่มีปฏิกิริยาสัมพันธกันระหว่าง HPC และ CADG ที่อัตราส่วน HTAC ต่อ PEO เท่ากับ 0.026 การเพิ่มขึ้นของค่ามวลโมเลกุลของสารประกอบรวม และจำนวนพันธะระหว่าง CADG กับ HPC พบว่าเกิดจากการรวมตัวกันระหว่างพอลิเมอร์ และสารลดแรงตึงผิว ที่สภาวะที่มีการรวมตัวต่ำสุด พบว่าเกิดจากการดึงดูดกันทางไฟฟ้าสถิตย์ระหว่างประจุบวกและลบภายในสายพอลิเมอร์

ACKNOWLEDGEMENTS

I would like to express my sincere gratitude and appreciation to the Petroleum and Petrochemical College (PPC) for providing the scholarship for my doctoral program and special thanks to National Metals and Materials Technology Center (MTEC) for funding the research work.

I express my deepest appreciation to my advisor, Professor Alexander M. Jamieson of Case Western Reserve University, Cleveland, Ohio, USA, for providing valuable suggestions, inspiring guidance, and giving me the opportunity to do my research work in his lab for 3 months.

My sincere gratitude to my advisor, Associate Prof. Anuvat Sirivat, for his continuous advice, motivation and support for the success of this study, and providing me with the chance to present my research work in Thailand and USA.

I would like to extend my heartfelt thanks to Associate Professor Kunchana Bunyakiat, Assistant Prof. Nantaya Yanumet, and Dr. Asira Fuongfuchat, who acted as committee members.

I also extend my sincere thanks to all of the staff of the Petroleum and Petrochemical College for giving the permission to freely use the research facilities.

Most of all, this work is dedicated to my parents and my husband, for their tender love and care, generous encouragement, understanding and moral support during this study.

| 4.63 | Zimm plot for HPC-CADG system at $c_s/c_p = 0.026$ | 130 |
| 4.64 | Zimm plot for HPC-CADG system at $c_s/c_p = 0.43$ | 130 |
| 5.1 | The proposed model for PEO-HTAC complex in aqueous solution at maximum binding | 134 |
| 5.2 | The proposed model for PEO-HTAC complex in 0.1 M KNO_3 solution at maximum binding | 135 |

ABBREVIATIONS

Polymers:

| | |
|-------|---|
| PEO | Poly(ethylene oxide) |
| EHEC | Ethylhydroxyethyl cellulose |
| PVP | Poly(vinyl pyrrolidone) |
| PVME | Poly(vinylmethyl ether) |
| POE | Poly(oxyethylene) |
| PEG | Poly(ethylene glycol) |
| HPC | Hydroxypropyl cellulose |
| HEC | Hydroxyethyl cellulose |
| PPO | Poly(propylene oxide) |
| PAM | Polyacrylamide |
| PVPNO | Poly(4-vinylpyridine N-oxide) |
| PCMA | Poly(N,N,N-trimethylammonio) ethyl acrylate |
| PAA | Polyacrylic acid |
| PE | Polyelectrolytes |

Surfactants:

| | |
|-------------------------------------|---|
| SDS | Sodium dodecylsulfate |
| DDAB | Didodecyltrimethylammonium bromide |
| HTAB, HTAC | Hexadecyltrimethylammonium bromide and chloride |
| DoTAB | Dodecyltrimethylammonium bromide |
| HTASal | Hexadecyltrimethylammonium salicylate |
| CTAB, CTAC | Cetyltrimethylammonium bromide and chloride |
| TTAB | Tetradecyltrimethylammonium bromide |
| RTAB, RTAC | Alkyltrimethylammonium bromide and chloride |
| NP ₁₄ , NP ₂₀ | Polyethylene oxide nonyl phenyl ether |
| Slovafof 909 | Nonylphenol polyethylene glycol |
| OTG | N-octyl thioglucoside |
| C ₁₂ E ₅ | Pentaethylene glycol mono-n-dodecyl ether |

LIST OF SYMBOLS

c_{mc} = Critical micelle concentration

c_{ac} = Critical aggregation concentration

M_w = Molecular weight of polymer in binary system

$M_{w,p}$ = Molecular weight of polymer in the complex

$M_{w,com}$ = Molecular weight of complex

D' = Preferential binding of surfactant to polymer

f = Binding fraction

N_s/N_p = Total number of surfactant per polymer chain

$N_{s,b}/N_p$ = Number of bound surfactant per polymer chain

R_g = Radius of gyration

R_h = Hydrodynamic radius

η_{sp} = Specific viscosity

η^* = Complex viscosity

η_0 = Zero-shear viscosity

G_0 = Shear plateau modulus

G' = Shear storage modulus

G'' = Shear loss modulus

G_R' = Reduced storage modulus

G_R'' = Reduced loss modulus

ω_R = Reduced frequency

τ_R = Terminal relaxation time

τ_{break} = Breaking time of worm-like micelle

τ_{rep} = Reptation time of worm-like micelle
