KEY WORD: ADSORPTION/ CUTTING FLUID/ MODIFIED / CHITOSAN/ REMOVAL

KOWIT PIYAMONGKALA: OIL REMOVAL FROM USED CUTTING FLUID BY CONTINUOUS ADSORPTION ON MODIFIED CHITIN-CHITOSAN. THESIS

ADVISOR: ASST. PROF. SANGOB TIP PONGSTABODEE, Ph.D., THESIS COADVISOR, ASSOC. PROF. LURSUANG MEKASUT, Dr.Ing., 259 pp.

The aim of this thesis is to study a removal of cutting fluids by adsorption on chitosan and modified chitosan. 10 adsorbents used in this study are chitosan, blended chitosan/PVA 1:1, benzoyl chitosan, quateraminated chitosan, chitosan-sodium lauryl sulfate, chitosan-hexadecyltrimethyl ammonium bromide, chitosan-polyoxyethylene sorbitanmonooleate, blended chitosan/PVA-sodium lauryl sulfate, blended chitosan/PVA-hexadecyltrimethyl ammonium bromide and blended chitosan/PVA-polyoxyethylene sorbitanmonooleate. Adsorption capacity of chitosan-sodium lauryl sulfate is the highest at pH 3 with amount of 2516 mg/g. After increasing pH of cutting fluids from pH 7 to 11, it can adsorb the cutting fluids from 747 to 309 mg/g. The adsorption capacity of adsorbents will be better when adding either NaCl or CaCl₂. The chitosan-sodium lauryl sulfate can adsorb cutting fluids through hydrophobic interaction. The significant uptake of cutting fluids on all adsorbents is supported by analysis contact angle, SEM, FT-IR, CHN and heating value. Langmuir, Freundlich and BET models were applied to describe the experimental isotherms. The experimental data fitted well with pseudo-second-order kinetic model. The cutting fluids adsorption was found to be controlled by intraparticle diffusion stage. The rate of adsorption cutting fluid increased with increasing temperature. The adsorption of cutting fluids is endothermic reaction. The bed depth/service time model can be used to predict the adsorption performance in a case when there is a change in flow rate.

ACKNOWLEDGMENTS

The author wishes to express his deepest gratitude to advisors, Assistant Professor Sangobtip Pongstabodee and Associate Professor Lursuang Mekasut for their guidance, encouragement and support given throughout the course of this study and Professor Pattarapan Prasassarakich, Associate Professor Tharapong Vitidsant, Associate Professor Kejvalee Pruksathorn, Dr. Pienpak Tasakorn and Assistant Professor, Narong Pungwiwat for their participation on the dissertation committee. The author wishes to thank the Department of Chemical Technology, Faculty of Science, Chulalongkorn University for financial support and the opportunity to conduct this study as well as their help to facilitate this study.

Finally, the author would like to express family gratitude and friends for their love, inspiration and endless encouragement throughout this entire study.

e_3	Correction in calories for heat of formation of fuse wire (J)
M	Weight of sample (g)
k_a	Adsorption rate constant
k_d	Desorption rate constant
θ	Coverage fraction ($0 \leq \theta \leq 1$)
C_t	Molar concentration of solute at any time (mg/l)
m_c	Mass of sorbent (g)
q_m	Maximum capacity of sorbent
M_w	Molar weight of solute (g/mol)
θ_e	Equilibrium coverage fraction
t	Time (min)
k_1	Rate constant of the pseudo-first-order model (min^{-1})
k_2	Rate constant of pseudo-second-order adsorption (mg/g-min)
r	Particle radius
D	Diffusivity within the particle
k_i	Intraparticle diffusion rate constant ($\text{g/g min}^{-0.5}$)
K_d	Adsorption rate constant (min^{-1})
C_a	Concentration of effluent cutting fluids at any particular time (mg/l)

h_p	Planck's constant (J-sec)
ΔH	Enthalpy change during adsorption (kJ/mol)
ΔS	Entropy change during adsorption (J/mol-K)
κ	Boltzmann's constant (J/K)
ΔG	Gibb free energy (kJ/mol)
A	Arrhenius energy (min^{-1})
E_a	Activation energy (kJ/mol)
t_z	Time required for the adsorption zone (min)
V_s	Total volume of cutting fluid spiked water treated between breakthrough and exhaustion (l)
Q_w	Influent flow rate (cm^3/min)
t_E	Time required for the adsorption zone to become established and move completely out of the bed (min)
V_E	Total volume of cutting fluids spiked water treated to the point of exhaustion (l)
U_z	Rate of the adsorption zone (cm/min)
h_z	Height of the adsorption zone (cm)
h	Height of bed depth (cm)
t_f	Time required for the adsorption zone to initially form (min)
F	Breakthrough fraction
V_B	Total volume of cutting fluids spiked water to the point of breakthrough (l)
S_z	Amount of cutting fluids that has been removed by the adsorption zone from breakthrough to exhaustion
