APPENDICES

Appendix A Amounts of Chemicals Used to Synthesize Hematite Particles and Yield Percentage of the Products

Table A1 Properties of the chemicals used in the experiment

Chemicals	Molecular formula	Molecular weight (g/mol)	Appearance	Solubility
Ferric chloride anhydrous	FeCl ₃	162.21	dark green powder	Easily soluble in cold, hot water
Ferrous chloride tetrahydrate	FeCl ₂ ·4H ₂ O	198.81	light yellow powder	Easily soluble in cold water
Sodium hydroxide	NaOH	40.00	white pellet	Easily soluble in cold water
Ammonia solution	NH ₃ ·H ₂ O	17.03	clear solution	Completely soluble in water
Sodium chloride	NaCl	58.44	white powder	Easily soluble in cold, hot water

Table A2 Amounts of chemicals used to synthesize hematite particles at various precursor concentrations with the constant $n_{\text{Fe(II)}}/n_{\text{Fe(III)}} = 0.02$, pH 7, 100 °C, and 1 h

Precursor conc.(M)	50 ml Fe(III) conc.(M)	Fe(II) weight(g)	6.0 M NaOH volume(ml)	1.0 M NaOH volume(ml)	Distilled water volume(ml)
0.1	0.2	0.0398	5.0	0.4	44.6
0.2	0.4	0.0795	10.0	0.8	39.2
0.3	0.6	0.1193	15.0	1.2	33.8
0.4	0.8	0.1590	20.0	1.6	28.4
0.5	1.0	0.1988	25.0	2.0	23.0

Table A3 Amounts of chemicals used to synthesize hematite particles at various precursor concentrations (dilution method) with the constant $n_{\text{Fe(II)}}/n_{\text{Fe(III)}} = 0.02$, pH 7, 100 °C, and 1h

Precursor conc. (M)	1.0M Fe(III) + water vol. (ml)	6.0M NaOH vol. (ml)	Fe(II) wt. (g)	1.0M NaOH vol. (ml)	Distilled water vol. (ml)
0.1	25.0 + 100	12.5	0.099405	1.0	111.5
0.2	25.0 + 37.5	12.5	0.099405	1.0	49.0
0.3	25.0 + 16.6	12.5	0.099405	1.0	28.2
0.4	25.0 + 6.25	12.5	0.099405	1.0	17.75
0.5	25.0 + 0	12.5	0.099405	1.0	11.5

Table A4 Amounts of chemicals used to synthesize hematite particles at various solution pHs with the constant $C = 0.3 \text{ M}$, $n_{\text{Fe(II)}}/n_{\text{Fe(III)}} = 0.02$, 100 °C, and 1h

Solution pH	1.0M Fe(III) + water vol. (ml)	6.0M NaOH vol. (ml)	Fe(II) wt. (g)	1.0M NaOH vol. (ml)	Distilled water vol. (ml)
pH 5	25.0 + 16.6	12.5	0.0994	0	29.2
pH 6	25.0 + 16.6	12.5	0.0994	1.0	28.2
pH 7	25.0 + 16.6	12.5	0.0994	2.0	27.2
pH 8	25.0 + 16.6	12.5	0.0994	3.0	26.2
pH 9	25.0 + 16.6	12.5	0.0994	3.5	25.7

Table A5 Amounts of chemicals used to synthesize hematite particles at various amounts of Fe(II) with the constant $C = 0.3$ M, pH 7, 100 °C, and 1 h

$n_{\text{Fe(II)}}/n_{\text{Fe(III)}}$	1.0M Fe(III) + water vol. (ml)	6.0M NaOH vol. (ml)	Fe(II) wt. (g)	1.0M NaOH vol. (ml)	Distilled water vol. (ml)
0.01	25.0 + 16.6	12.5	0.0497	0.5	28.7
0.02	25.0 + 16.6	12.5	0.0994	1.0	28.2
0.03	25.0 + 16.6	12.5	0.1491	1.5	27.7
0.04	25.0 + 16.6	12.5	0.1988	2.0	27.2
0.05	25.0 + 16.6	12.5	0.2485	2.5	26.7

Table A6 Amounts of chemicals used to synthesize hematite particles at various ionic strength (I) values with the constant $C = 0.3$ M, $n_{\text{Fe(II)}}/n_{\text{Fe(III)}} = 0.02$, pH 7, 100 °C, and 1 h

I (M)	1.0M Fe(III) + water vol. (ml)	6.0M NaOH vol. (ml)	Fe(II) wt. (g)	1.0M NaOH vol. (ml)	5.0M NaCl vol. (ml)	Distilled water vol. (ml)
1.0	25.0 + 16.6	12.5	0.0994	1.0	1.5	26.7
1.2	25.0 + 16.6	12.5	0.0994	1.0	4.8	23.4
1.4	25.0 + 16.6	12.5	0.0994	1.0	8.1	20.0
1.6	25.0 + 16.6	12.5	0.0994	1.0	11.5	16.7
1.8	25.0 + 16.6	12.5	0.0994	1.0	14.8	13.4
2.0	25.0 + 16.6	12.5	0.0994	1.0	18.1	10.0

Note: The ionic strength (I) of the solution is calculated from equation (A1) as follow:

$$I = \sum_{i=1}^n C_i Z_i^2 \quad (\text{A1})$$

where I = ionic strength (mol/L)

C_i = molar concentration of each individual ion in the solution (mol/L)

Z_i = valence of each individual ion in the solution

Table A7 Summary of yield percentage (%) of the synthesized hematite particles at various precursor concentrations with the constant $n_{\text{Fe(II)}}/n_{\text{Fe(III)}} = 0.02$, pH 7, 100 °C, and 1h

Sample	Calculated weight (g)	Sample weight (g)	Yield percentage (%)
Hematite $C = 0.05 \text{ M}$	0.3992	0.1425	35.7
Hematite $C = 0.1 \text{ M}$	0.7985	0.4862	60.9
Hematite $C = 0.2 \text{ M}$	1.5969	1.2484	78.2
Hematite $C = 0.3 \text{ M}$	2.3954	1.9968	83.4
Hematite $C = 0.4 \text{ M}$	3.1938	2.7951	87.5
Hematite $C = 0.5 \text{ M}$	3.9923	3.5689	89.4

Appendix B XRD Patterns of the Synthesized Hematite Nanoparticles

A powder X-ray diffractometer (Bruker AXS, D8 Advance) was used to examine the crystal structure of the synthesized hematite particles which were below the nanometer scale. The Cu K α ($\lambda = 1.5406 \text{ \AA}$) radiation source was operated at 40 kV/30 mA and used the K β filter to eliminate the interference peak. Divergence slit and scattering slit 0.5 deg together with 0.3 mm of receiving slit were set on the instrument. The hematite powder was placed into a sample holder and the measurement was continuously run. The experiments were recorded by monitoring the diffraction in the diffraction angle (2θ) range from 10.000 to 80.000 deg with a scan speed of 1.000 deg/min and a scan step of 0.020 deg.

The crystallite sizes of the synthesized hematite nanoparticles could be estimated from the XRD patterns by using Scherrer's equation (B1) as follow:

$$D = \frac{k\lambda}{\beta \cos\theta} \quad (\text{B1})$$

where D = crystallite size (nm)

k = grain shape dependent constant (assumed to be 0.89 for the spherical particles)

λ = wave length of X-ray beam (nm) ($\lambda = 0.15406 \text{ nm}$ for Cu K α radiation)

β = full width at half maximum (FWHM) for the considered diffraction peak (rad)

θ = diffraction angle ($^{\circ}$)

Note: For hematite, the crystallite sizes calculated from (104) diffraction peak located at $2\theta = 33.2^{\circ}$

Table B1 Summary of the estimated crystallite sizes of the synthesized hematite nanoparticles from the XRD patterns using Scherrer's equation

Sample	104 peak (°)	FWHM (°)	Crystallite size (nm)
Hematite $C = 0.1 \text{ M}$	33.168	0.403	20.3
Hematite $C = 0.3 \text{ M}$	33.230	0.245	33.5
Hematite $C = 0.5 \text{ M}$	33.238	0.203	40.4

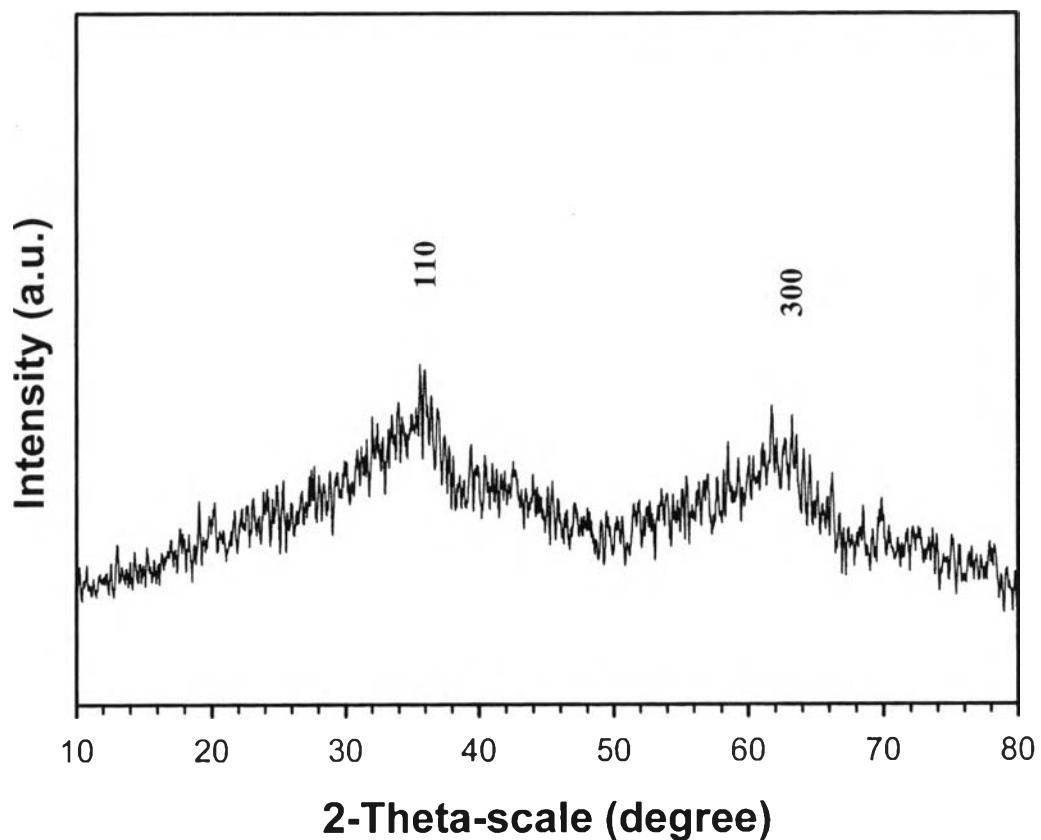

Figure B1 XRD pattern of the 2-line ferrihydrite precursor ($C = 0.3 \text{ M}$, and pH 7).

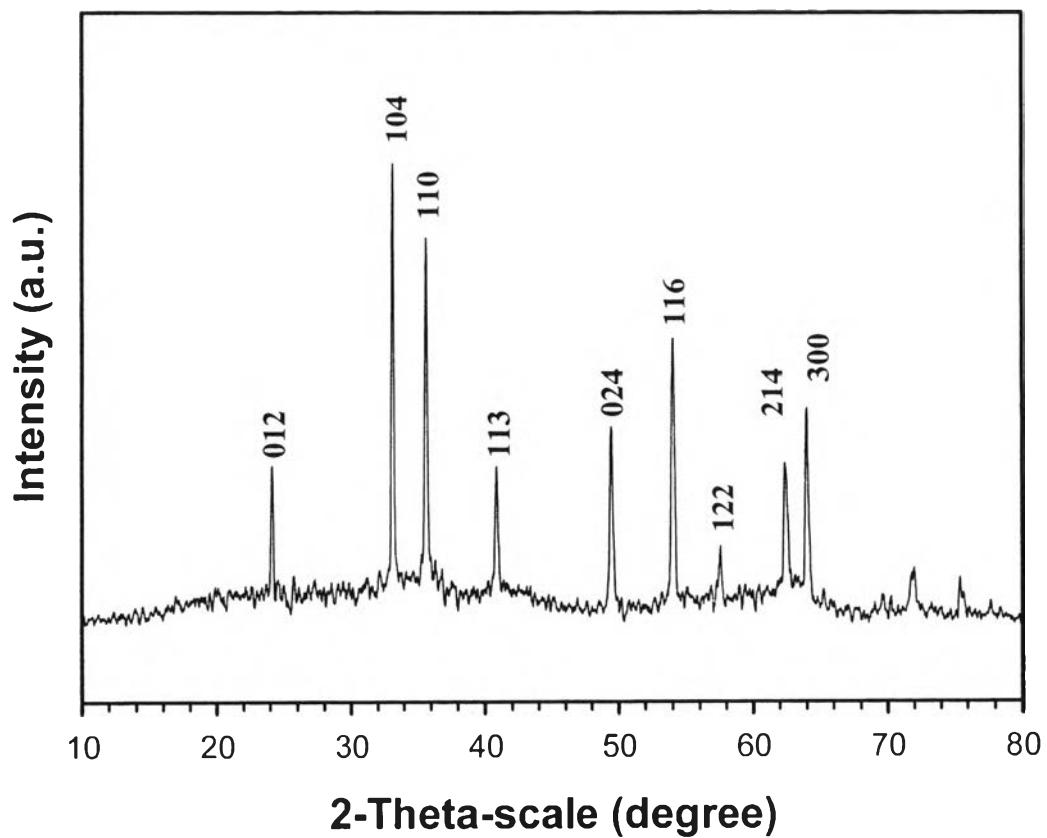

Figure B2 XRD pattern of the synthesized hematite nanoparticles ($C = 0.1$ M, $n_{\text{Fe(II)}}/n_{\text{Fe(III)}} = 0.02$, pH 7, 100 °C, and 1h).

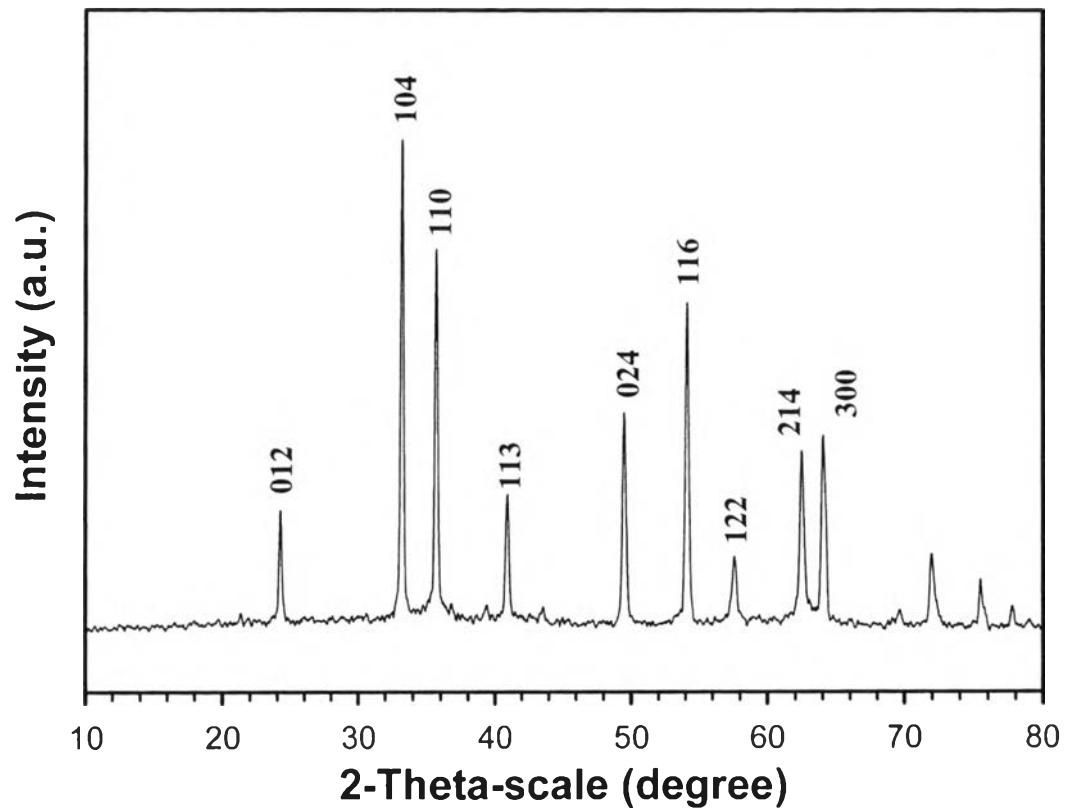

Figure B3 XRD pattern of the synthesized hematite nanoparticles ($C = 0.3$ M, $n_{\text{Fe(II)}}/n_{\text{Fe(III)}} = 0.02$, pH 7, 100 °C, and 1h).

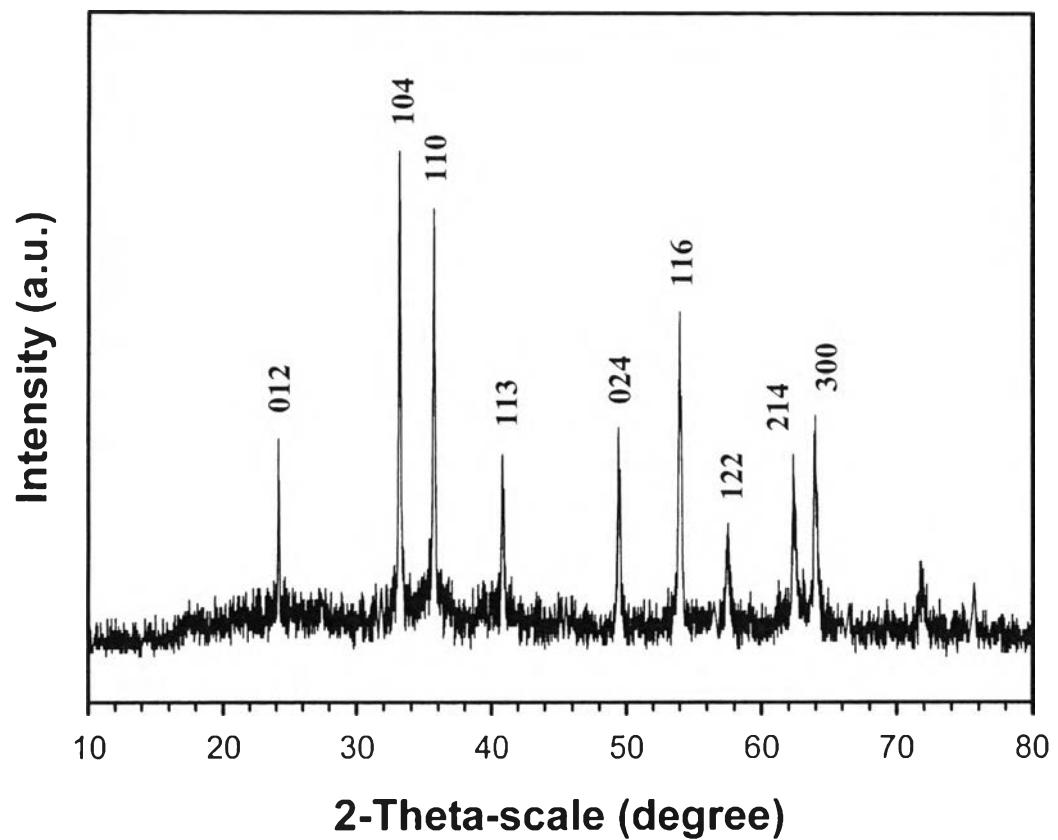

Figure B4 XRD pattern of the synthesized hematite nanoparticles ($C = 0.5$ M, $n_{\text{Fe(II)}}/n_{\text{Fe(III)}} = 0.02$, pH 7, 100 °C, and 1h).

Table B2 Powder X-ray diffraction data of ferrihydrite and hematite (Joint Committee on Powder Diffraction Standard; JCPDS) (adapted from Cornell and Schwertmann, 2003)

Ferrihydrite ($\text{Fe}_5\text{HO}_8 \cdot 4\text{H}_2\text{O}$)				Hematite ($\alpha\text{-Fe}_2\text{O}_3$)			
2θ (°)	<i>I</i>	<i>hkl</i>	<i>d</i> (nm)	2θ (°)	<i>I</i>	<i>hkl</i>	<i>d</i> (nm)
35.452	100	110*	0.250	24.033	30	012	0.3684
39.920	80	112	0.221	33.027	100	104	0.2700
45.505	80	113	0.196	35.452	70	110	0.2591
52.579	50	114	0.172	40.798	20	113	0.2207
60.771	70	115	0.151	49.212	40	024	0.1841
62.260	80	300*	0.148	53.888	45	116	0.1694
Note: There are two types of ferrihydrite: 2-line ferrihydrite; and 6-line ferrihydrite (the stars (*) are assigned to peaks of 2-line ferrihydrite).				57.168	10	122	0.1599
				62.260	30	214	0.1486
				63.687	30	300	0.1454
				71.403	10	<u>1010</u>	0.1312
				74.679	8	220	0.1259

Note: 2θ is the diffraction angle (°); *I* is the relative intensity; *hkl* is the Miller indices; and *d* is the spacing between the adjacent (*hkl*) lattice planes (nm).

Appendix C FT-IR Spectra of the Synthesized Hematite Nanoparticles

A Fourier transform infrared spectrometer (Thermo Nicolet, Nexus 670), with a deuterated triglycine sulfate detector, was used to characterize the functional groups of the synthesized hematite particles. For the KBr-pellet technique, optical grade KBr (Carlo Erba Reagent) was used as the background material. The hematite powder was grounded in a motar and mixed with dried KBr at ratio of the sample:KBr was about 1:20, then the mixed powder was compressed into the pellets under the pressure of 7 tons. The absorption mode was run 64 scans with a resolution of $\pm 4 \text{ cm}^{-1}$ in the wave number in range of $4000\text{-}400 \text{ cm}^{-1}$.

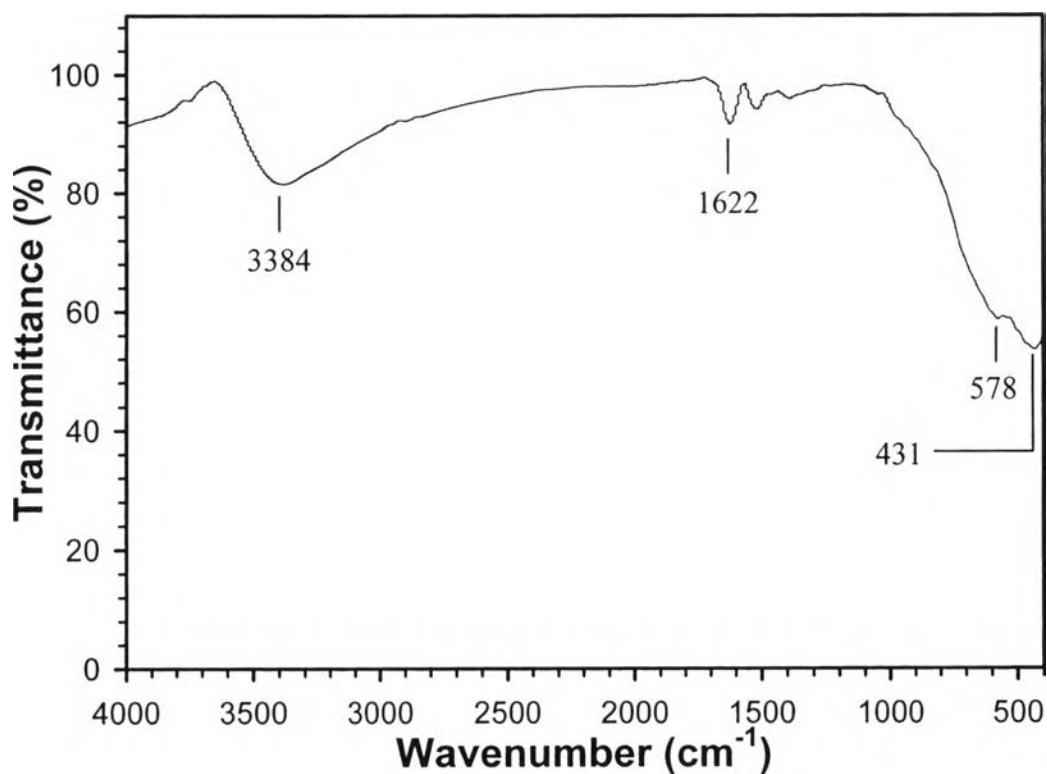

Figure C1 FT-IR spectrum of the 2-line ferrihydrite precursor ($C=0.3 \text{ M}$, and pH 7).

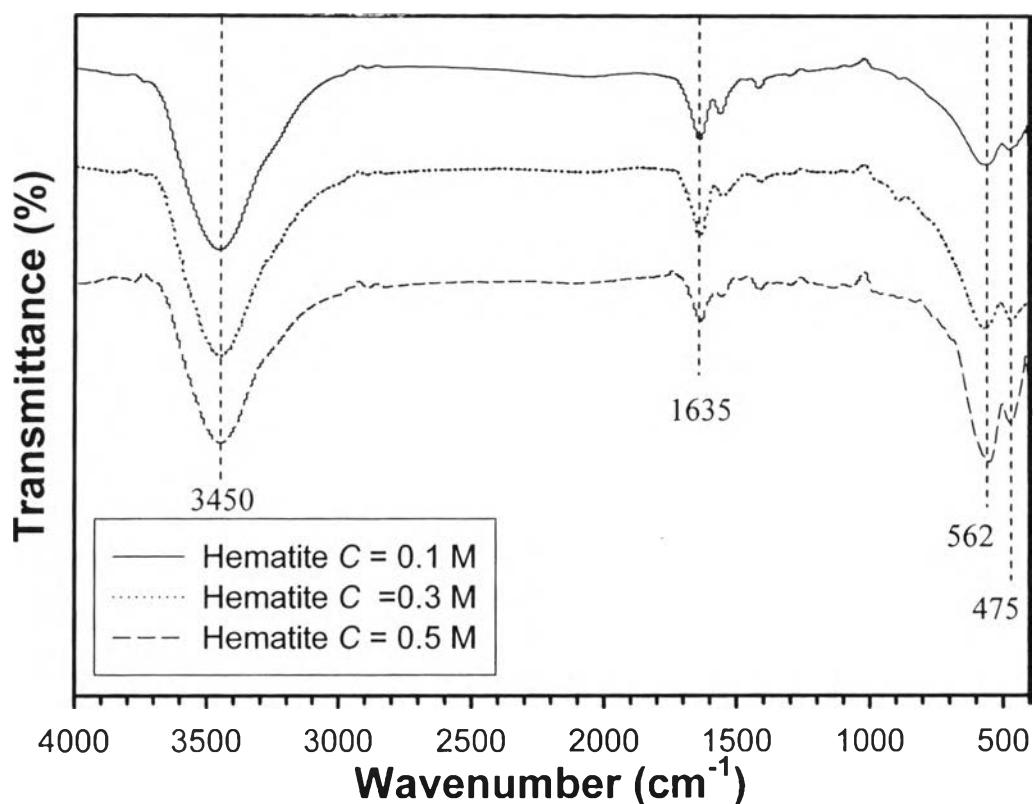

Figure C2 FT-IR spectra of the synthesized hematite nanoparticles ($n_{\text{Fe(II)}}/n_{\text{Fe(III)}} = 0.02$, pH 7, 100 °C, and 1h).

Table C1 Summary of FT-IR bands of the 2-line ferrihydrite precursor and the synthesized hematite nanoparticles

Sample	Observed wavenumbers (cm ⁻¹)	
	Adsorbed water	Fe-O bond
2-line ferrihydrite	3384 and 1621	577 and 430
Hematite C = 0.1 M	3452 and 1638	567 and 477
Hematite C = 0.3 M	3448 and 1637	569 and 472
Hematite C = 0.5 M	3449 and 1632	560 and 475

Table C2 Peak positions for IR bands of ferrihydrite and hematite

Sample	Functional groups	Wavenumbers (cm ⁻¹)	References
Ferrihydrite (Fe₅HO₈·4H₂O)	Adsorbed or lattice water (stretching and bending vibration of water molecules)	3357 and 1622	(Ristic <i>et al.</i> , 2007)
		~3400 and ~1600	(Liu <i>et al.</i> , 2009)
	Fe-O bond	580 and 441	(Ristic <i>et al.</i> , 2007)
		~585 and ~459	(Liu <i>et al.</i> , 2009)
Hematite (α-Fe₂O₃)	Adsorbed water (stretching and bending vibration of water molecules)	3420 and 1635	(Jing and Wu, 2004)
		3359.8 and 1616.2	(Liu <i>et al.</i> , 2007)
	Fe-O bond	560 and 479	(Jing and Wu, 2004)
		578.6 and 474.3	(Liu <i>et al.</i> , 2007)

Appendix D TG/DTA Curves of the Synthesized Hematite Nanoparticles

A thermogravimetric/differential thermal analyzer (Perkin Elmer, Pyris Diamond) was used to determine the thermal behaviour of the synthesized hematite particles. The experiment was carried out by weighting a powder sample of 1-5 mg and loaded into a platinum pan. The mass change under the temperature scan from 30 to 600 °C at a heating rate of 10 °C/min and under the nitrogen flow was monitored and recorded.

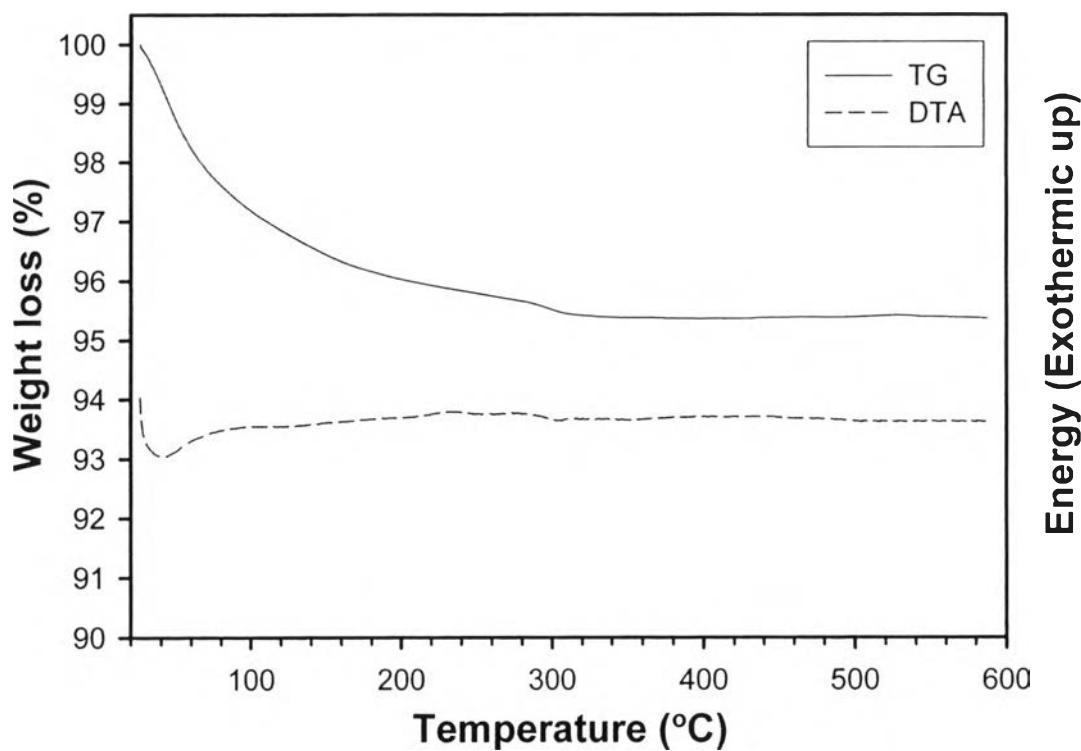

Figure D1 TG-DTA curves of the synthesized hematite nanoparticles ($C = 0.3$ M, $n_{\text{Fe(II)}}/n_{\text{Fe(III)}} = 0.02$, pH 7, 100 °C, and 1h).

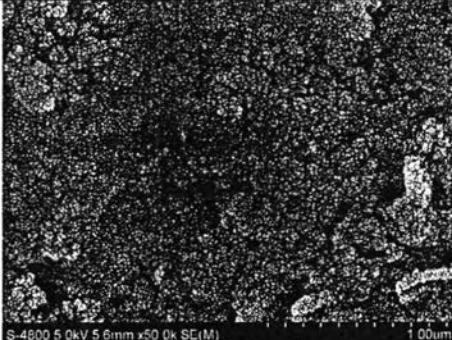

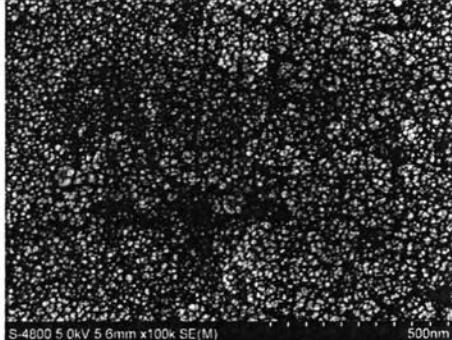

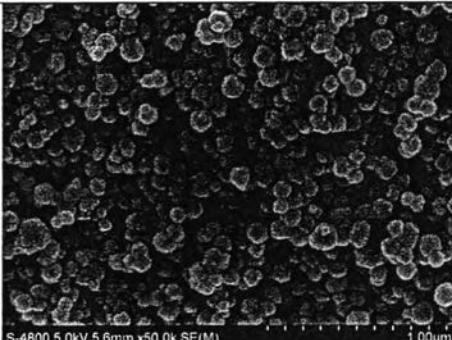

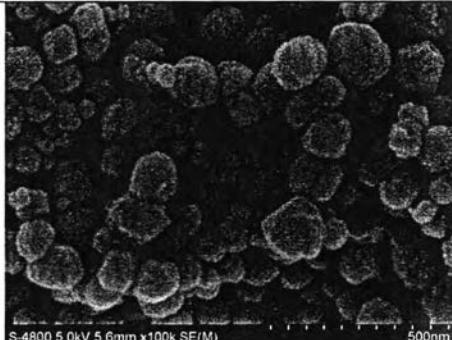

Table D1 Thermal behavior assignations for TG/DTA curves of hematite

Mode	Behavior	Temperature (°C)	References
DTA	Endothermic peak (elimination of adsorbed water on the surface)	25-50	(Kandori <i>et al.</i> , 2008)
TG	Mass loss about 4.0 % (removal of adsorbed water)	below 200	(Lu <i>et al.</i> , 2006)
	Mass loss about 0.5 % (elimination of hydroxyl group)	200-400	(Lu <i>et al.</i> , 2006)

Appendix E FE-SEM Images of the Synthesized Hematite Nanoparticles

A field-emission scanning electron microscope (Hitachi, S-4800) was used to examine the morphological structure and to determine the particle size of the synthesized hematite particles. The sample powder was placed on the holder with an adhesive tape and coated with a thin layer of platinum using an ion sputtering device (Hitachi, E-1010) for 100 sec prior to observation under FE-SEM. The scanning electron images were investigated by using an acceleration voltage of 5.0 kV with a magnification in the range of 50.0-200k times.

Appendix F Particle Sizes and Particle Size Distributions of the Synthesized Hematite Nanoparticles

The particle size and particle size distribution of the synthesized hematite particles were determined by the professional image processing and analysis software of SemAfore over 2-3 FE-SEM images by the quantitative statistical method. There are multiple definitions for mean diameter value because this value is associated with the basis of the distribution calculation (number, surface, volume). The general form of the mean particle diameter is defined using equation (F1) as follows:

$$D[p, q] = \left(\frac{\sum_{i=1}^n n_i D_i^p}{\sum_{i=1}^n n_i D_i^q} \right)^{\frac{1}{p-q}} \quad (\text{F1})$$

where $D[p, q]$ = general form of the mean diameter

n_i = number of the i^{th} particle

D_i = diameter of i^{th} particle

$(p-q)$ = algebraic power of $D[p, q]$

The particle size of hematite could be characterized by $D[1,0]$ and $D[4,3]$ which are the number mean diameter (D_n ; equation (F2)) and volume mean diameter (D_v ; equation (F3)), respectively.

$$D_n = D[1,0] = \frac{\sum_{i=1}^n n_i D_i}{\sum_{i=1}^n n_i} \quad (\text{F2})$$

$$D_v = D[4,3] = \frac{\sum_{i=1}^n n_i D_i^4}{\sum_{i=1}^n n_i D_i^3} \quad (\text{F3})$$

In addition, the particle size distribution index could be determined by the polydispersity index (PDI) using equation (F4) as follows:

$$PDI = \frac{D_v}{D_n} = \frac{D[4,3]}{D[1,0]} \quad (\text{F4})$$

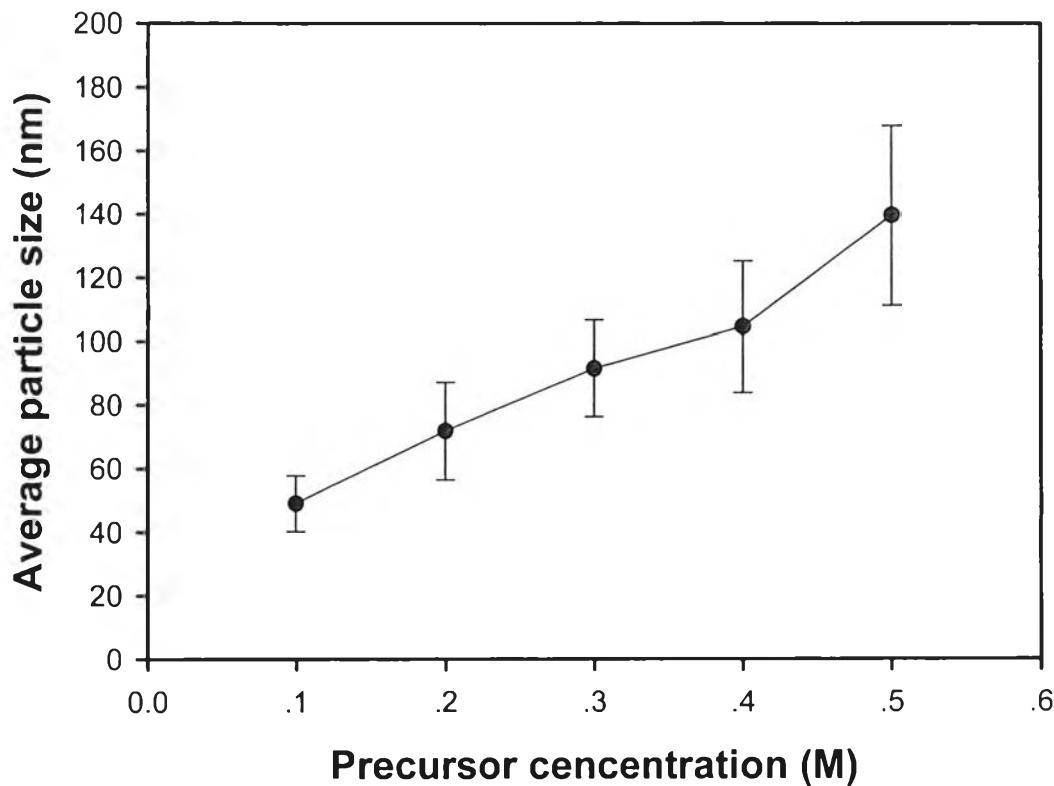

Figure F1 Average particle sizes of the synthesized hematite at various precursor concentrations with the constant $n_{\text{Fe(II)}}/n_{\text{Fe(III)}} = 0.02$, pH 7, 100 °C, and 1h.

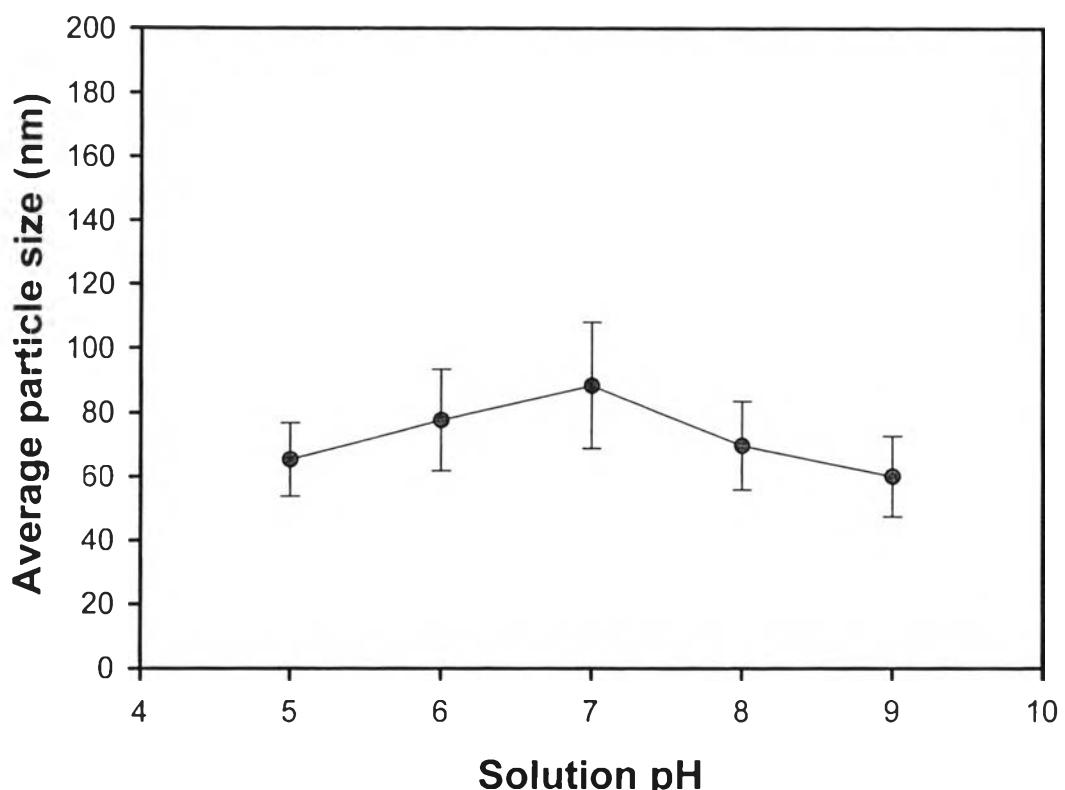

Figure F2 Average particle sizes of the synthesized hematite at various solution pHs with the constant $C = 0.3$ M, $n_{\text{Fe(II)}}/n_{\text{Fe(III)}} = 0.02$, 100 °C, and 1 h.

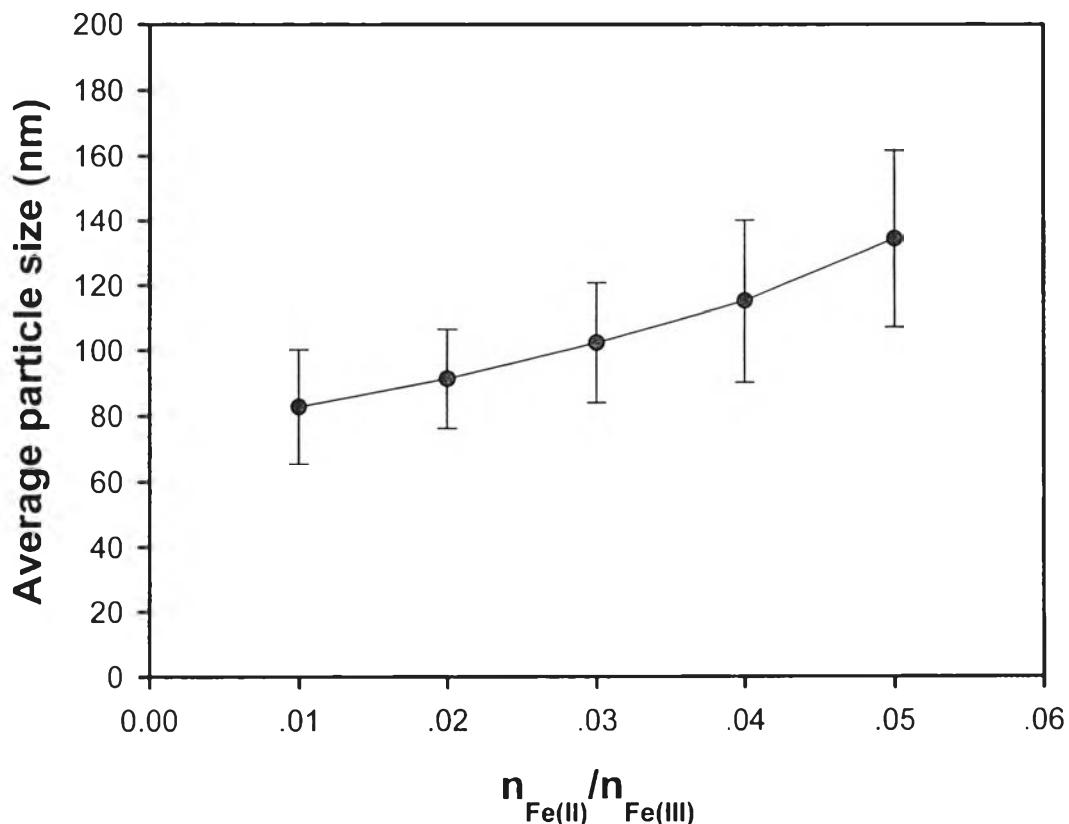

Figure F3 Average particle sizes of the synthesized hematite at various amounts of Fe(II) with the constant $C = 0.3 \text{ M}$, pH 7, 100 °C, and 1h.

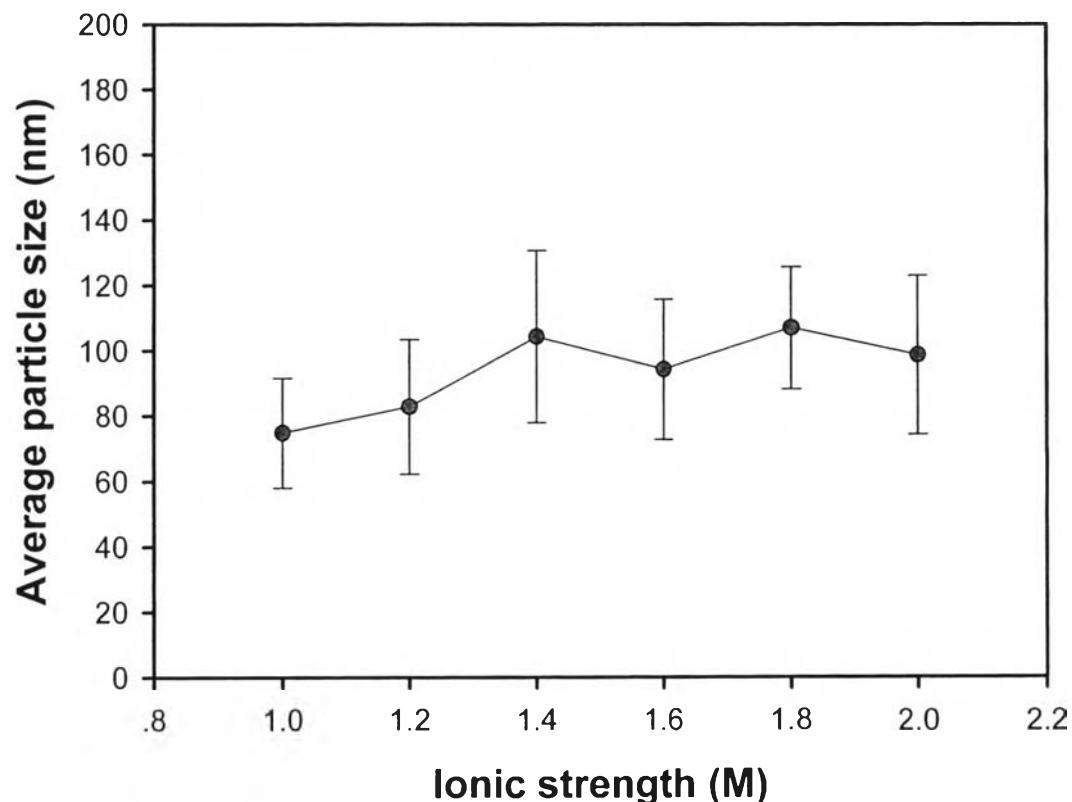

Figure F4 Average particle sizes of the synthesized hematite at various ionic strength (I) values with the constant $C = 0.3$ M, $n_{\text{Fe(II)}}/n_{\text{Fe(III)}} = 0.02$, pH 7, 100 °C, and 1 h.

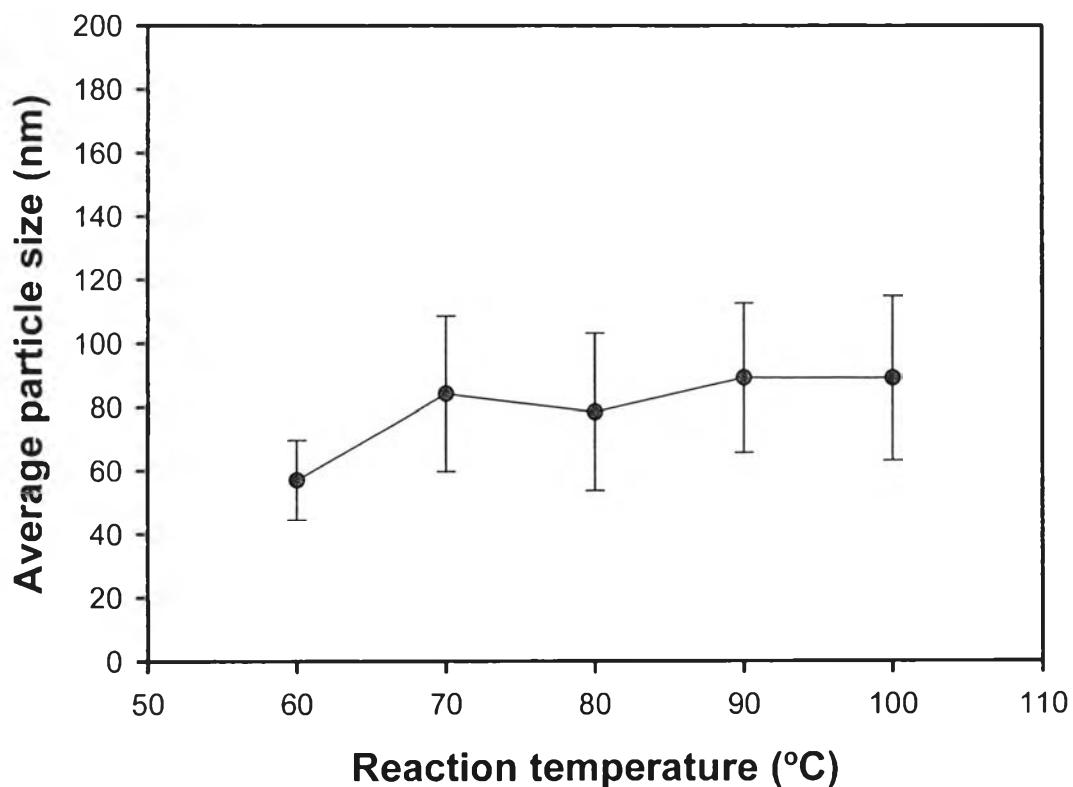

Figure F5 Average particle sizes of the synthesized hematite at reaction times with the constant $C = 0.3$ M, $n_{\text{Fe(II)}}/n_{\text{Fe(III)}} = 0.02$, pH 7, and 1 h.

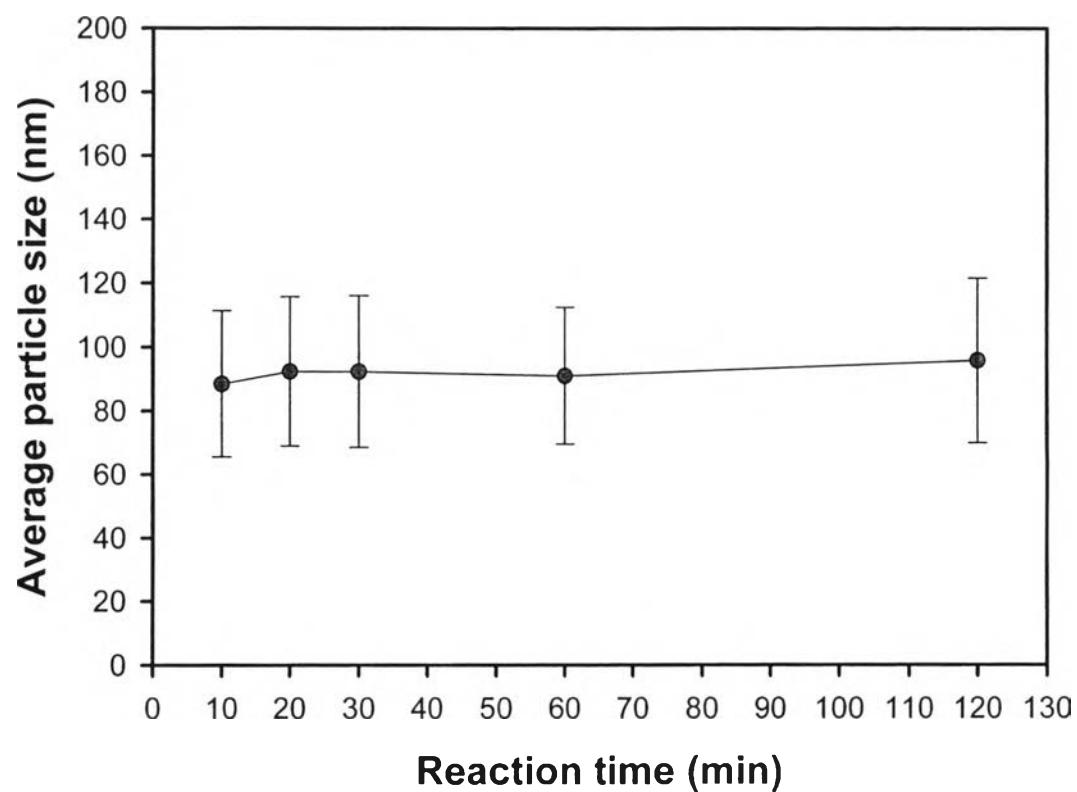

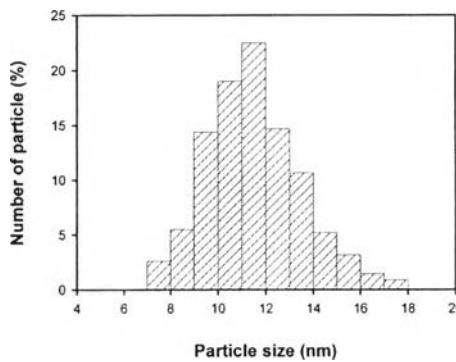

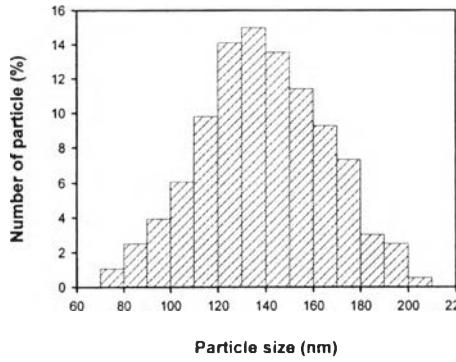

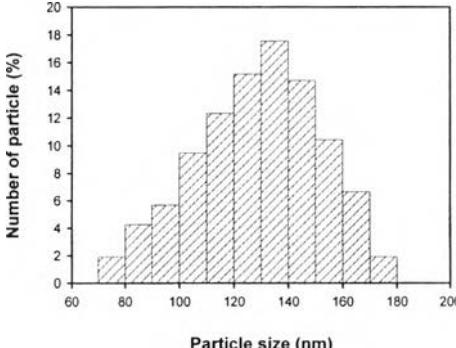

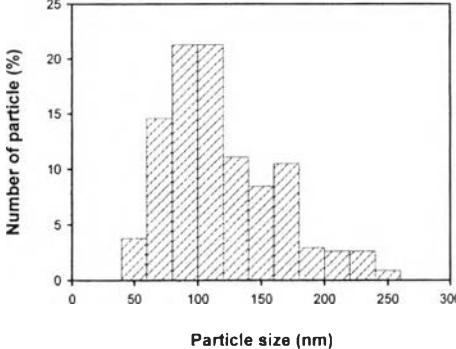

Figure F6 Average particle sizes of the synthesized hematite at reaction times with the constant $C = 0.3$ M, $n_{\text{Fe(II)}}/n_{\text{Fe(III)}} = 0.02$, pH 7, and 100 °C.

Appendix G Specific Surface Area Measurement of the Synthesized Hematite Nanoparticles

A surface area analyzer (Thermo finnigan, Sorptomatic 1990) was used to measure the specific surface area of the synthesized hematite particles. The absorbent sample was weighed and outgassed at 300 °C for 12 h under vacuum to eliminate volatile adsorbate on the surface. The data were obtained by adsorption and desorption with He and N₂ gases. The BET surface area was determined by using the static volumetric method.

In addition, the specific surface area (SSA) could be estimated from the particle size of the spherical particle using equation (G1) as follow:

$$SSA = \frac{6}{D[3,2] \times \rho_s} \quad (G1)$$

where SSA = specific surface area (m²/g)

$D[3,2]$ = surface mean diameter (nm) or D_s

ρ_s = solid density (g/m³) for hematite particle ρ_s is about 5.26×10^6 g/m³

Note: This equation is strictly correct only for the spherical particles but may be used without correction for shape if the particles are not too asymmetrical and the surface mean diameter can be calculated from equation (G2) as follow:

$$D_s = D[3,2] = \frac{\sum_{i=1}^n n_i D_i^3}{\sum_{i=1}^n n_i D_i^2} \quad . \quad (G2)$$

where n_i = number of the ith particle

D_i = diameter of ith particle

Table G1 Summary of the specific surface area of the synthesized hematite nanoparticles with different particle sizes and morphologies

Sample		Specific surface area (m^2/g)

Ellipsoid	151.7	7.5	7.6

Appendix H Electrical Conductivity Measurement of the Synthesized Hematite Nanoparticles

An electrometer (Keithley, 6517A), with a custom-built two-point probe, was used to measure the electrical conductivity which is the inversion of specific resistivity (ρ) that indicates the ability of material to transport electrical charge. The meter consisted of a probe making contact on the surface of the sample in a disc shape. This probe was connected to a power supplier source for a constant source and for reading current. The applied voltage was plotted versus the resultant current to determine the linear Ohmic regime of each sample based on the Van der Pauw method. The applied voltage and the current in the linear Ohmic regime were converted to the electrical conductivity of the sample using equation (H1) as follow:

$$\sigma = \frac{1}{\rho} = \frac{1}{R_s \times t} = \frac{I}{K \times V \times t} = \frac{\text{slope}}{K \times t} \quad (\text{H1})$$

where σ is the specific conductivity (S/cm), ρ is the specific resistivity ($\Omega \cdot \text{cm}$), R_s is the sheet resistivity (Ω), I is the resultant current (A), K is the geometric correction factor, V is the applied voltage (V), and t is the thickness of the disc sample (cm).

The geometrical correction factor was taken into account of geometric effects, depending on the configuration and probe tip spacing and was determined by using standard materials where specific resistivity values were known; we used silicon wafer chips (SiO_2). In our case, the sheet resistivity was measured by using the two-point probe and then the geometric correction factor was calculated by equation (H2) as follow:

$$K = \frac{\rho}{R \times t} = \frac{I \times \rho}{V \times t} = \text{slope} \times R_s \quad (\text{H2})$$

where K is the geometric correction factor, ρ is the known resistivity of standard silicon wafer ($\Omega \cdot \text{cm}$), t is the film thickness (cm), R is the film resistance (Ω), and I is the resultant current (A).

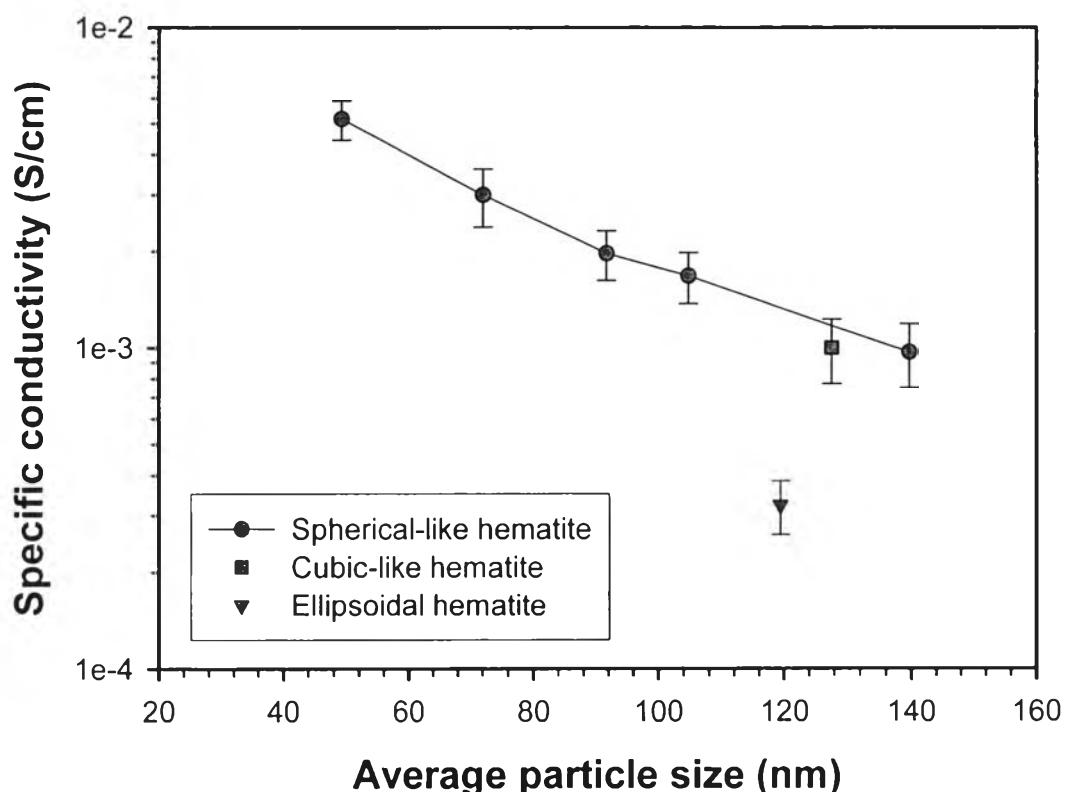

Figure H1 Specific conductivities of the synthesized hematite nanoparticles with different particle sizes.

Table H1 Summary of the specific conductivities of the 2-line ferrihydrite precursor and the synthesized hematite nanoparticles with different particle sizes and morphologies

Sample	Particle size (nm) $(\bar{X} \pm SD)$	Specific conductivity (S/cm)	
		Avg.	SD
Ferrihydrite	11.5 ± 2.0	5.51E-02	8.47E-03
Hematite $C = 0.1\text{ M}$	49.3 ± 8.8	5.16E-03	7.20E-04
Hematite $C = 0.2\text{ M}$	72.1 ± 15.3	2.99E-03	6.13E-04
Hematite $C = 0.3\text{ M}$	91.7 ± 15.1	1.97E-03	3.46E-04
Hematite $C = 0.4\text{ M}$	104.7 ± 20.6	1.68E-03	3.03E-04
Hematite $C = 0.5\text{ M}$	139.5 ± 28.2	9.72E-04	2.20E-04
Cubic-like hematite	127.5 ± 24.3	1.00E-03	2.29E-04
Ellipsoidal hematite	119.4 ± 44.3	3.22E-04	6.13E-05

Note: The synthesized hematite particles using precursor concentration 0.1-0.5 M possessed the spherical-like morphology.

Table H2 Raw data for determination of the linear Ohmic regime to calibrate probe by using a standard silicon wafer ($R_s = 107.373 \Omega$)

0.030	0.26485	0.26491	0.26216	0.26397		
0.020	0.18628	0.18342	0.18279	0.18416		
0.010	0.12530	0.12617	0.12626	0.12591		

Example H1: Calculation of the geometric correction factor (K)

The geometric correction factor was calculated by equation (G2) as follow:

$$K = slope \times R_s$$

$$K = (6.8574 \times 10^{-6} \Omega^{-1})(107.373 \Omega)$$

$$K = 7.3630 \times 10^{-4}$$

So, the geometric correction factor (K) was 7.3630×10^{-4} .

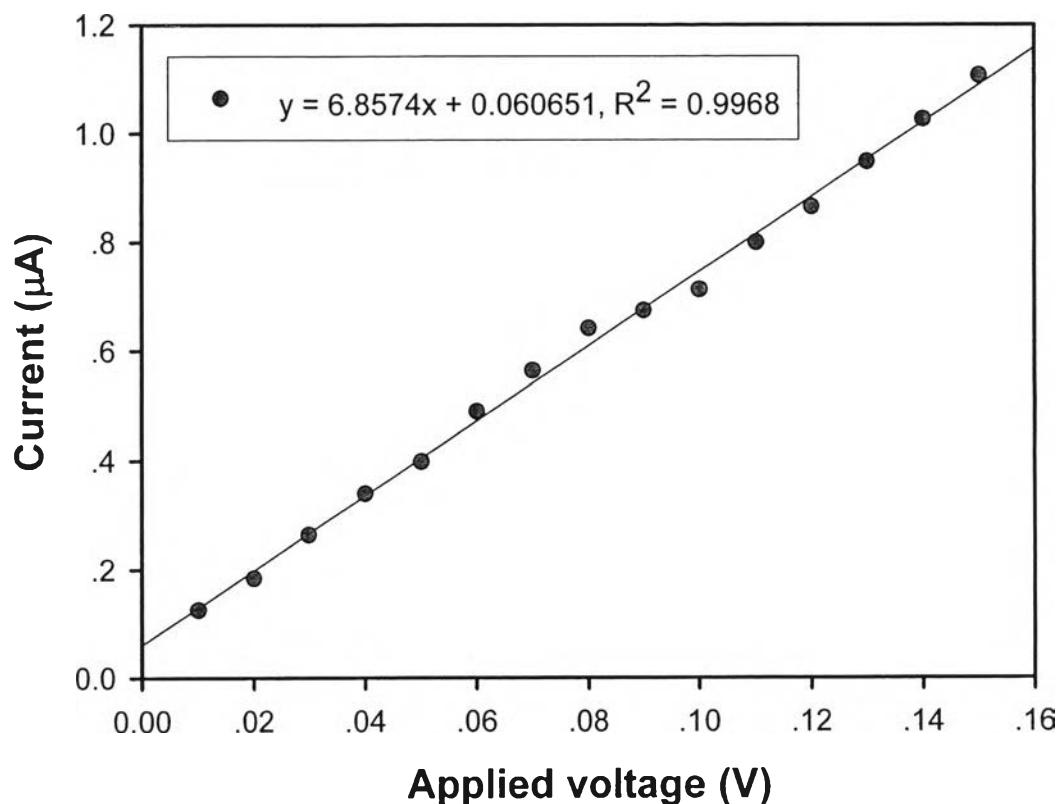

Figure H2 The linear Ohmic regime plot of the standard silicon wafer ($R_s = 107.373 \Omega$).

Average specific conductivity							5.51E-02	
Standard deviation							8.47E-03	

Note: The bold values are the average values of the data.

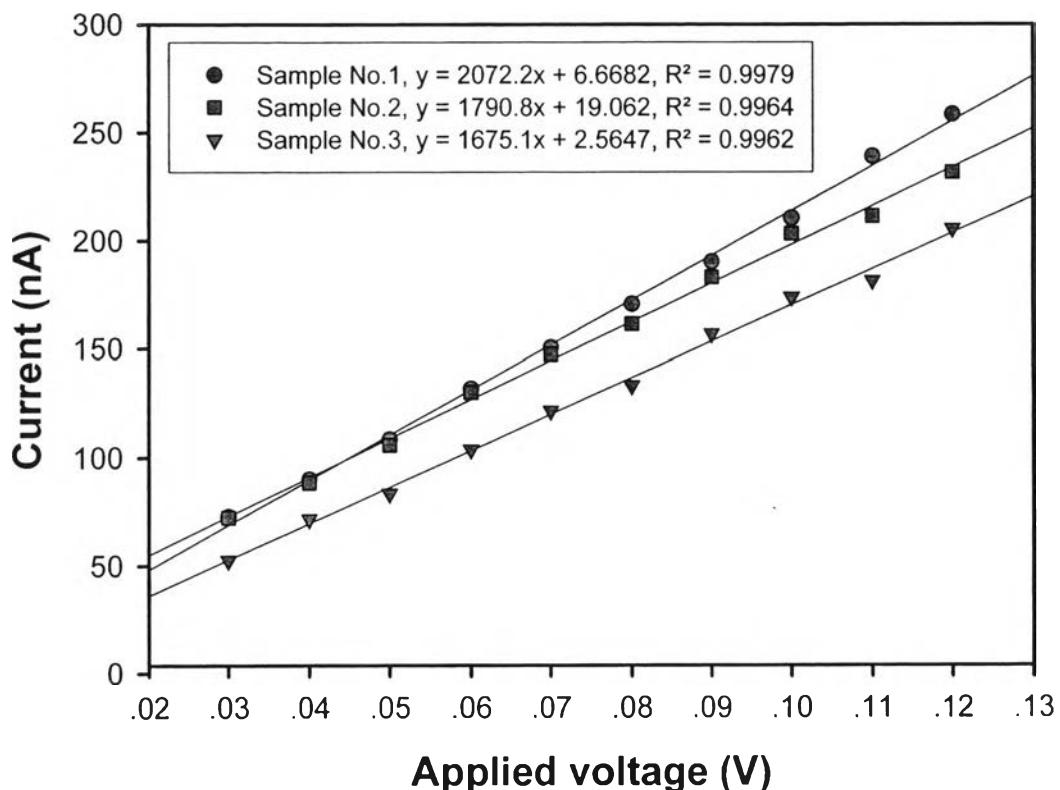

Figure H3 The linear Ohmic regime plots of the 2-line ferrihydrite precursor.

Example H2: Calculation of the specific conductivity (σ) of the sample no.1

The specific conductivity (σ) was calculated by equation (G2) as follow:

$$\sigma = \frac{\text{slope}}{K \times t}$$

$$\sigma = \frac{(2.0722 \times 10^{-6} \Omega^{-1})}{(7.3630 \times 10^{-4})(0.0439 \text{ cm})}$$

$$\sigma = 6.41 \times 10^{-2} \text{ S/cm}$$

So, the specific conductivity (σ) of the sample no.1 was $6.41 \times 10^{-2} \text{ S/cm}$.

Average specific conductivity							9.72E-04	
Standard deviation							2.20E-04	

Note: The bold values are the average values of the data.

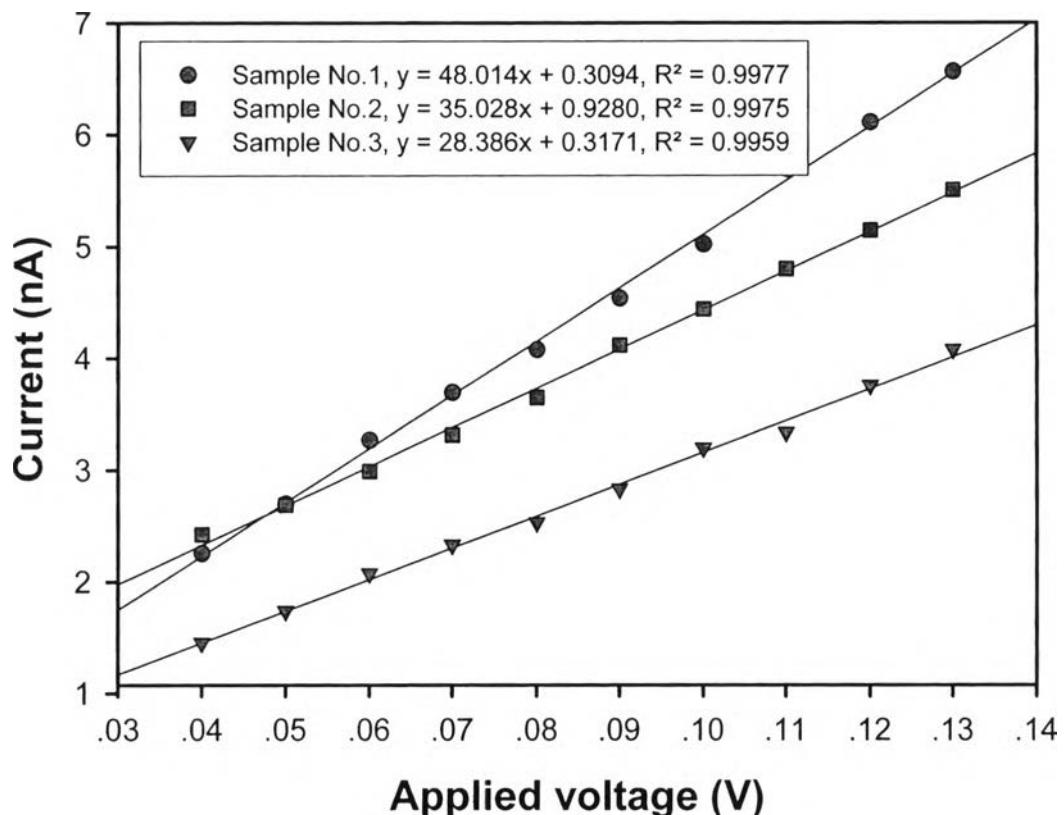

Figure H10 The linear Ohmic regime plots of the synthesized hematite nanoparticles (139.5 ± 28.2 nm).

Appendix I Magnetic Properties Measurement of the Synthesized Hematite Nanoparticles

A vibrating sample magnetometer (LakeShore, 7404), with a 4-inch electromagnet, was used to study the magnetic properties of the synthesized hematite particles. The magnetization curves were measured under the maximum magnetic field strength of 8000.0 Oe at room temperature to determine the hysteresis loops. The data were taken with a scan speed of 10 sec/point to complete the 280 points of the hysteresis loop.

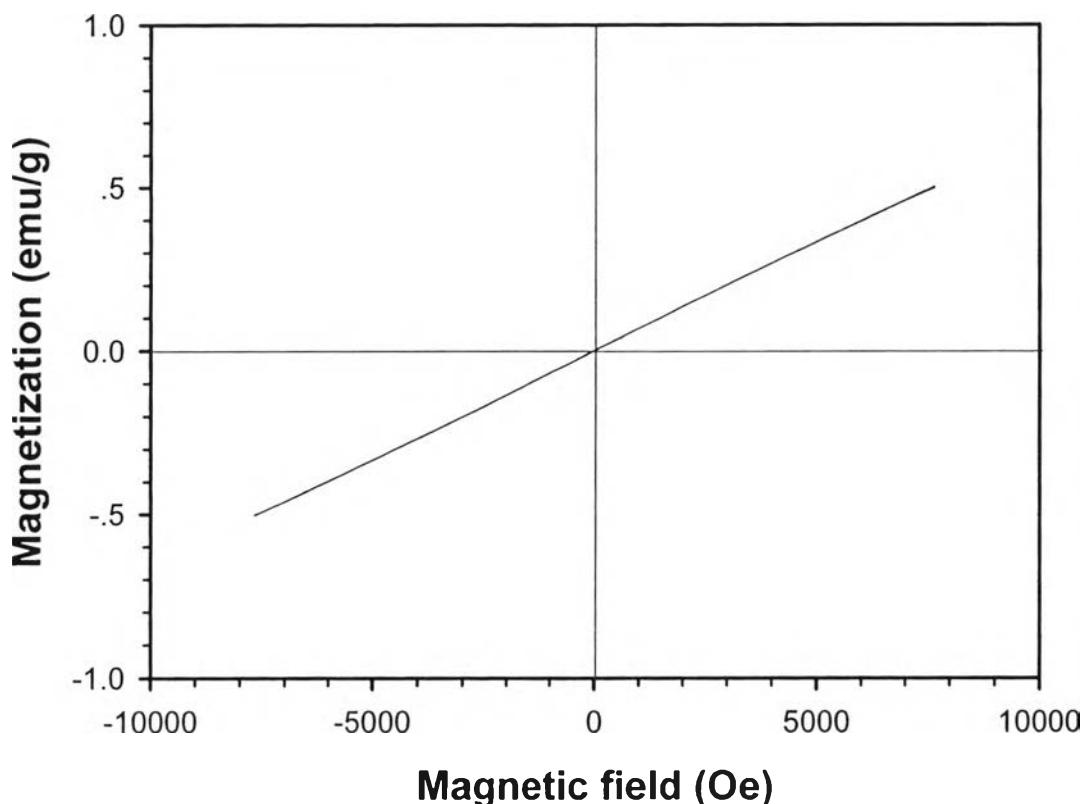

Figure I1 Room temperature magnetization curve of the 2-line ferrihydrite precursor ($C = 0.3$ M, and pH 7).

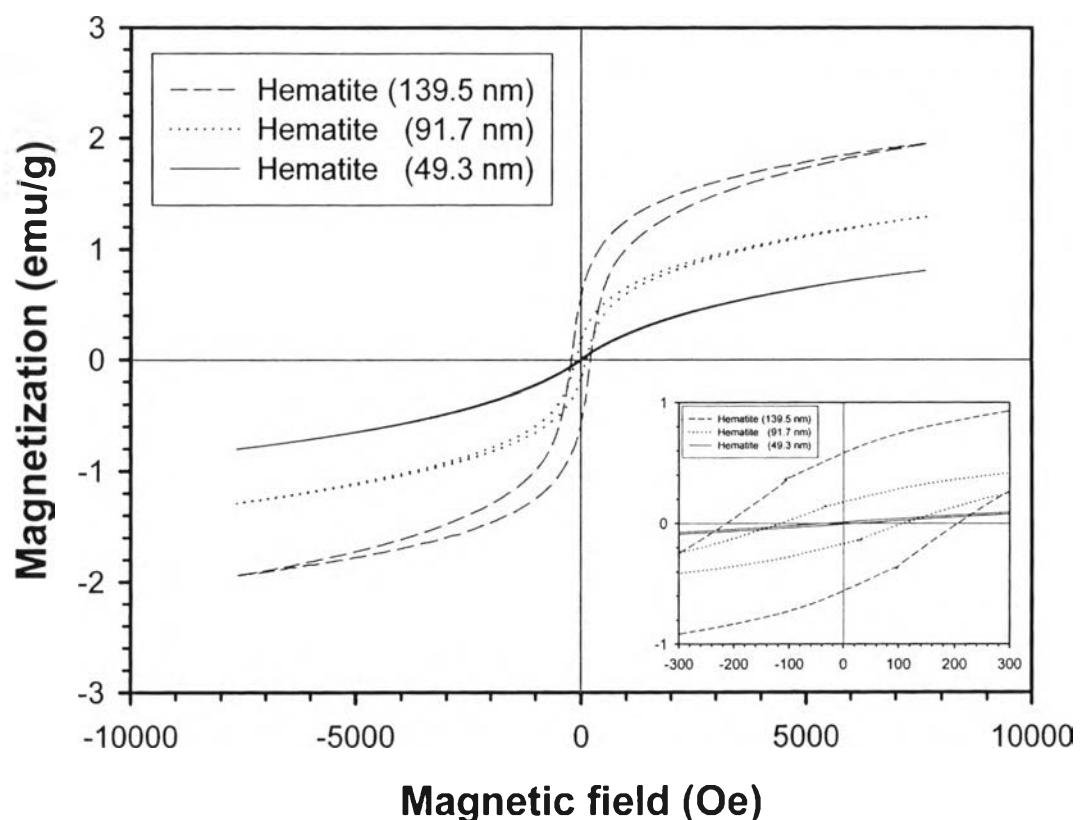

Figure I2 Room temperature magnetization curves of the synthesized hematite nanoparticles with different particle sizes.

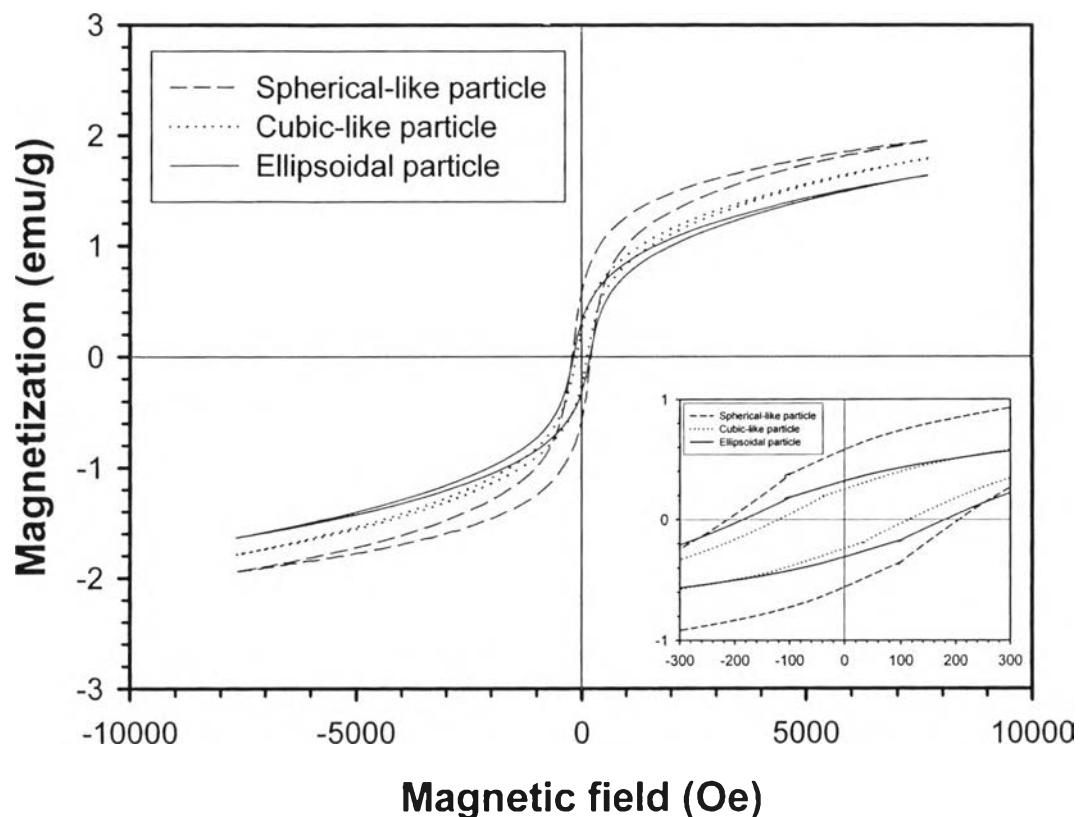

Figure I3 Room temperature magnetization curves of the synthesized hematite nanoparticles with different morphologies (dash line is the same line as represented in Figure I2).

Table I1 Summary of the magnetic parameters of the synthesized hematite nanoparticles with different particle sizes and morphologies

Sample		Magnetic parameters			
Particle shape	Particle size (nm) ($\bar{X} \pm SD$)	H_c (Oe)	M_r (emu/g)	M_s (emu/g)	M_r/M_s
Sphere	49.3 ± 8.8	30.2	0.00946	0.8018	0.01179
Sphere	91.7 ± 15.1	115.3	0.17104	1.2874	0.13286
Sphere	139.5 ± 28.2	211.5	0.56480	1.9433	0.29064
Cube	127.5 ± 24.3	120.2	0.24456	1.7863	0.13691
Ellipsoid	119.4 ± 44.3	185.2	0.31185	1.6332	0.19095

Note: H_c is the coercive force; M_r is the remanence magnetization (at $H = 0$ Oe); and M_s is the saturation (maximum) magnetization.

CURRICULUM VITAE

Name: Mr. Kitibodee Supattarasakda

Date of Birth: July 19, 1987

Nationality: Thai

University Education:

2006 – 2009 Bachelor Degree in Petrochemicals and Polymeric Materials, Faculty of Engineering and Industrial Technology, Silpakorn University, Nakhon Pathom, Thailand

Proceedings:

1. Supattarasakda, K.; and Sirivat, A. (2012, April 24). Synthesis and Characterization of Size-controlled Hematite ($\alpha\text{Fe}_2\text{O}_3$) Nanoparticles via the Chemical Precipitation Method. Proceedings of the 3rd Research Symposium on Petrochemical, and Materials Technology and the 18th PPC Symposium on Petroleum, Petrochemicals, and Polymers, Ballroom, Queen Sirikit National Convention Center, Bangkok, Thailand.

Presentation:

1. Supattarasakda, K.; and Sirivat, A. (2012, April 24). Synthesis and Characterization of Size-controlled Hematite ($\alpha\text{Fe}_2\text{O}_3$) Nanoparticles via the Chemical Precipitation Method. Paper presented at the 3rd Research Symposium on Petrochemical, and Materials Technology and the 18th PPC Symposium on Petroleum, Petrochemicals, and Polymers, Ballroom, Queen Sirikit National Convention Center, Bangkok, Thailand.
