APPENDICES

Appendix A Sulfonation Process and Degree of Sulfonation

Sulfonation process is the method for attaching a sulfonic group onto the polymer backbone. 2.0 g of the polysulfone (PSF) was dissolved in 10 mL of dichloromethane (DCM) and vigorously stirred at room temperature until homogeneous. Then the sulfuric acid was added into the polymer solution and stirred continuously for 4 h. The sulfonated polymer was precipitated into methanol ice bath under continuous stirring. The precipitate was filtered and washed by using distilled water until the pH of polymer became neutral. The sulfonated polymer was dried at 100 °C for 24 h.

Degree of sulfonation (DS) is represented by the number of sulfonic acid group per repeating unit of polymer. The DS of sulfonated polymer was determined by titration the sulfonated polymer solution with 0.01 M NaOH using phenolphthalein as an indicator. The DS was calculated by the following Eq (A1):

$$DS(\%) = \frac{(V_{NaOH} \times M_{NaOH})/1000}{\text{Mole of polymer membrane}} \times 100 \quad (A1)$$

where V_{NaOH} refers to the volume of sodium hydroxide solution, and C_{NaOH} refers to the concentration of sodium hydroxide solution.

Table A1 Sulfonation condition of PSF at 25 °C for 4 h for film casting

Weight of PSF (g)	Mole of PSF	Volume of H ₂ SO ₄ (ml)	Mole of H ₂ SO ₄	H ₂ SO ₄ /PSF Mole ratio	DCM Volume (ml)	Volume Fraction	Yield (%)	DS (%)
1.2151	0.0027	20	0.05	17	10	0.64	99.51	12.75

2.0104	0.045	30	0.18	40	10	0.72	85.36	19.90
2.0163	0.045	30	0.27	60	10	0.72	98.89	61.44
2.0085	0.045	30	0.36	80	10	0.72	109.3	71.55

Appendix B Identification of FT-IR Spectrum of Polysulfone and Sulfonated Polysulfone

The polymers (PSF) and sulfonated polymers (S-PSF) functional groups were determined using the FT-IR spectrometer (Nicolet, Nexus 670). The samples were measured directly in the wave number range of 400-1600 cm^{-1} with a resolution of 4 cm^{-1} and 64 scans using potassium bromide (KBr; dried at 100 °C for 24 h) as a background materials. The composite material composed of sample and KBr was compressed into pellets and inserted in the sample holder (Macksasitorn *et al.*, 2012).

Figure B1 FT-IR spectra of polysulfone (PSF) and sulfonated polysulfone (S-PSF) at 0.72 of degree of sulfonation.

Appendix C Nuclear Magnetic Resonance (NMR)

The structure of sulfonated PSF was determined by a NMR spectrometer (Bruker Biospin Avance 500 MHz NMR spectrometer) using deuterated dimethyl sulfoxide (DMSO- d_6) as the solvent at room temperature.

Figure C1 ^1H -NMR spectrum for sulfonated Polysulfone (S-PSF).

The proton resonance at 7.72 ppm is assigned to the proton adjacent to the new pendent sulfonic acid on the PSF structure [Devrim *et al.*, 2009].

Table C1 Chemical Shift (ppm) from $^1\text{H-NMR}$ spectra for S-PSF

Position	Type of Proton	S-PSF	Literature	
		Chemical Shift (ppm)	Chemical Shift (ppm)	Author, Year
1', 4'	Aromatic-H	6.95	6.9	Devrim, 2009
			6.95	Unnikrishnan, 2012
1, 4	Aromatic-H	7.05	7.1	Devrim, 2009

**Figure C2** Chemical structure of Sulfonated Polysulfone (S-PSF).

Appendix D Thermogravimetric Analysis

The thermal property of the polymers and sulfonated polysulfone (S-PSF) and S-PSF/Zeolite Y composite membranes were investigated using a Thermogravimetric/Differential Thermal Analyzer (TG/DTA; Perkin Elmer, Pyris Diamond). The samples were inserted into an alumina pan at the weight of 4-10 mg and. The measurements were carried out under nitrogen flow with the temperature range of 30 °C to 700 °C at a heating rate of 10 °C. min⁻¹ (Zhang *et al.*, 2011).

Figure D1 TGA thermograms of polysulfone (PSF) and sulfonated polysulfone (S-PSF) at 0.72 of degrees of sulfonation.

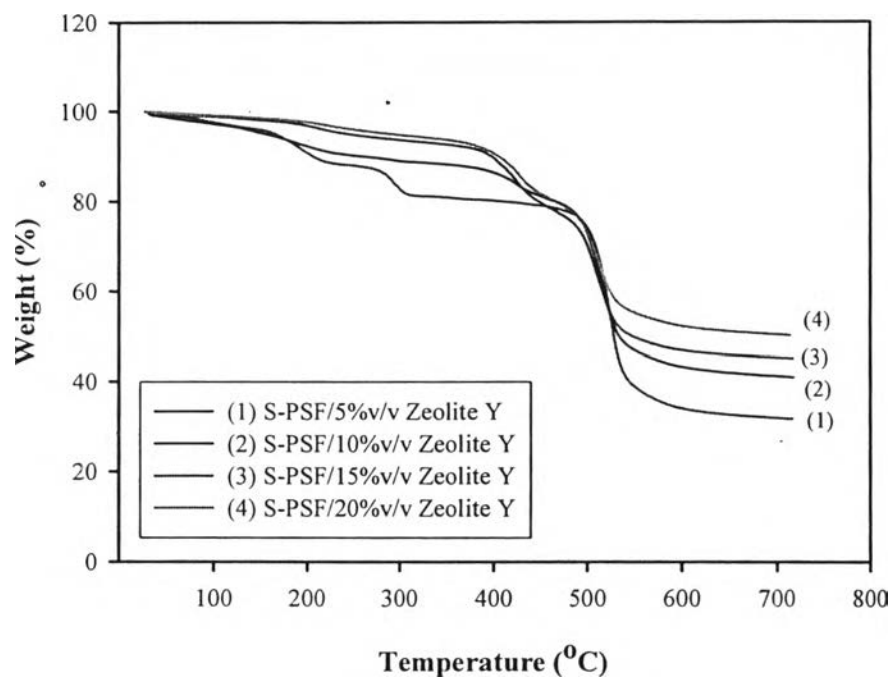

Figure D2 TGA curve for S-PSF/Zelolite Y composite membranes.

Figure D3 TGA curve for S-PSF/S-GO composite membranes.

Table D1 Thermal stability of S-PSF and S-PSF/Zeolite Y composite membranes

Sample	Temperature (°C)	Degradation
S-PSF (DS = 0.7155)	50 – 180	Loss of water and residual solvent during casting
	180 – 400	Decomposition of sulfonic acid groups
	> 400	Degradation of S-PSF backbone
S-PSF/5% v/v Zeolite Y	50 – 240	Loss of water and residual solvent during casting
	240 – 400	Decomposition of sulfonic acid groups
	> 400	Degradation of S-PSF backbone
S-PSF/10% v/v Zeolite Y	50 – 260	Loss of water and residual solvent during casting
	260 – 430	Decomposition of sulfonic acid groups
	> 430	Degradation of S-PSF backbone
S-PSF/15% v/v Zeolite Y	50 – 300	Loss of water and residual solvent during casting
	300 – 440	Decomposition of sulfonic acid groups
	> 440	Degradation of S-PSF backbone
S-PSF/20% v/v Zeolite Y	50 – 320	Loss of water and residual solvent during casting
	320 – 440	Decomposition of sulfonic acid groups
	> 440	Degradation of S-PSF backbone

Table D2 Thermal stability of S-PSF/S-GO composite membranes

Sample	Temperature (°C)	Degradation
S-PSF/1% v/v S-GO	50 – 220	Loss of water and residual solvent during casting
	220 – 380	Decomposition of sulfonic acid groups
	> 380	Degradation of S-PSF backbone
S-PSF/2% v/v S-GO	50 – 250	Loss of water and residual solvent during casting
	250 – 400	Decomposition of sulfonic acid groups
	> 400	Degradation of S-PSF backbone
S-PSF/3% v/v S-GO	50 – 225	Loss of water and residual solvent during casting
	225 – 410	Decomposition of sulfonic acid groups
	> 410	Degradation of S-PSF backbone
S-PSF/5% v/v S-GO	50 – 220	Loss of water and residual solvent during casting
	220 – 380	Decomposition of sulfonic acid groups
	> 380	Degradation of S-PSF backbone
S-PSF/7% v/v S-GO	50 – 215	Loss of water and residual solvent during casting
	215 – 400	Decomposition of sulfonic acid groups
	> 400	Degradation of S-PSF backbone

Appendix E Proton Conductivity Under Dry State

The impedance data was measured by using an impedance phase analyzer HP 4194 at various frequencies from 100 Hz to 2 MHz and at room temperature. The membranes were cut into $5 \times 5 \text{ cm}^2$ specimens for the measurement. The proton conductivity was calculated from EQ. E.1:

$$\sigma \text{ (S/cm)} = \frac{d}{R \times A} \quad (\text{E1})$$

where d is the sample thickness (cm), A is the contact area of the sample ($\pi r^2 = \pi(3.8/2)^2 = 11.34 \text{ cm}^2$), and R can be derived from the low intercept of the high frequency semi-circle on a complex impedance plane with the $\text{Re}(Z)$ axis.

Appendix F Proton Conductivity Under Wet State

The impedance data was measured by using an LCR meter (Agilent E4980A) at various frequencies from 100 Hz to 2 MHz and at room temperature. The membranes were cut into $5 \times 5 \text{ cm}^2$ specimens and immersed in distilled water at 27°C for 24 h before the measurement. The proton conductivity was calculated from Eq. F1:

$$\sigma \text{ (s/cm)} = \frac{d}{R \times A} \quad (\text{F1})$$

where d is the sample thickness, A is the contact area of the sample ($\pi r^2 = \pi(3.8/2)^2 = 11.34 \text{ cm}^2$), and R can be derived from the low intercept of the high frequency semi-circle on a complex impedance plane with the $\text{Re}(Z)$ axis.

Appendix G Methanol Permeability

The methanol permeability shows the amount of methanol that permeates through the membrane. The permeation cell for the methanol permeability measurement consisted of chamber A and chamber B separated by a sulfonated polymer membrane. Chamber A was filled with a 250 ml 2.5 M methanol solution. Chamber B was filled with 250 ml DI water. The membrane was placed between the chamber A and chamber B. The methanol permeability was determined by the following Eq (G1):

$$P \text{ (cm}^2\text{/s)} = \frac{k_B \times V_B \times L}{A \times (C_A - C_B)} \quad (\text{G1})$$

where P = the methanol permeability, C_A = the methanol concentrations in the compartment A, C_B = the methanol concentrations in the compartment B, A = the area of a membrane, L = the thickness of a membrane, V_B = the volume of the solution in the compartment B, and k_B = the slope of the methanol concentration.

The methanol concentrations were determined by using gas chromatography (GC) with thermal conductivity detector (TCD); ethanol was used as the internal standard:

Calibration procedure

- The syringe was cleaned before sampling with DI water.
- Methanol solutions were prepared at various concentrations (0.01, 0.05, 0.1, 0.5, 1.0, 1.5, 2.0, 2.5, and 3.0 M). Methanol solution was pumped by a syringe about 0.05 ml and deposited in a bottle.
- Methanol permeability was calculated by TCD GC with a 1M 0.05ml ethanol solution as an internal standard.
- The calibration curve was established by plotting C_B with the peak ratio of MeOH/EtOH.

Measurement procedure

- The syringe was cleaned before sampling with DI water.
- Components A and B were pumped by a syringe about 0.05 ml and deposited in a bottle.
- Methanol permeability was calculated by TCD GC with 1M 0.05ml ethanol solution as an internal standard.
- The methanol concentration in component B (C_B) was determined by comparing the peak ratio of methanol/ethanol to calibration curve.

Appendix H Water Uptake

The membranes were immersed into DI water for 24 h at room temperature. Superabundant water was absorbed from the membrane surface with a wiping paper and the membranes were weighed (noted as W_s). The membranes were dried at 100 °C for 24 h in an oven and weighed again (noted as W_d). The percentage of water uptake was then calculated as following Eq. (H1):

$$\text{Water uptake} = \frac{(W_s - W_d)}{W_d} \times 100 \quad (\text{H1})$$

where W_d refers to the weight of dried polymer, and W_s is weight of swelled polymer.

Figure H1 Water uptake (%) for S-PSF and S-PSF/Zeolite Y composite membranes.

Appendix I Mechanical Properties

The mechanical properties: tensile strength, yield strain, and young's modulus, were recorded using a universal testing machine (Lloyd, model SMT2-500N) at room temperature with $25 \text{ mm}\cdot\text{min}^{-1}$ speed. The membranes (thickness less than 1.0 mm) were cut into $1 \text{ cm} \times 5 \text{ cm}$. The measurements were taken at least 5 times.

Table I1 Mechanical property of PSF

Sample	Breadth (mm)	Area (mm ²)	Tensile Strength (MPa)	Yield Strain (%)	Young's Modulus (MPa)

S-PSF/3S-GO/12Y	14.9 ± 3.8	2.3 ± 0.8	1209 ± 102
S-PSF/3S-GO/15Y	13.5 ± 4.1	2.0 ± 0.9	1383 ± 96

Appendix J X-ray Photoelectron Spectroscopy (XPS)

XPS technique was used for the determination of the surface composition of the GO and S-GO. The XPS spectra were obtained by using an incident achromatic MgK α X-ray source (1253.6 eV) operated at 14.8 kV and 20 mA for excitation and a hemisphere analyzer (Thermo VG scientific). The high-resolution XPS spectra were composite averages of 10 scans with a passing energy of 50 eV. The pressure in the analysis chamber was in the range of 10^{-8} Torr during data collection. The binding energy was adjusted to the C1s peak at 285.1 eV. Data analysis and curve deconvolution were accomplished by using the Thermo Advantage Spectra Data Processor software. The samples were dried at 100 °C for 24 h before testing.

Figure J6 C1s region XPS spectra of S-GO

Table J1 Summary of S 2p and C 1s XPS spectral data

Bond	Sample	Assignment	Binding Energy (eV)	FWHM	Area
S2p	S-GO	S(2p _{3/2})	167.6	1.566	1946.3
		S(2p _{1/2})	168.8	1.594	1190.5
C1s	GO	C=C	283.5	0.815	58406.6
		C-C / C-H	284.3	1.542	25125.8
		C-OH	285.9	1.283	6529.2
		C-O-C	286.9	1.234	3986.4
		C=O	288.4	1.578	4048.9
		O-C=O	290.1	2.825	8244.1
		C=C	282.5	0.712	91736.7
	S-GO	C-C / C-H	283.1	0.768	22181.9
		C-OH / C-S	283.9	1.560	25063.8
		C-O-C	285.3	1.684	9684.2
		C=O	286.7	2.078	12771.4
		O-C=O	288.5	1.476	5083.0

Appendix K Scanning Electron Microscopy (SEM)

The surface morphology of GO and S-GO was investigated using a scanning electron microscope, Model S4800 (Hitachi), operated at 5kV and 15 mA. The samples were dried at 100 °C for 24 h before testing.

Figure K1 SEM images of the surface of: (a) GO and (b) S-GO.

CURRICULUM VITAE

Name: Mr. Phuwadon Bunlengsuwan

Date of Birth: December 5, 1990

Nationality: Thai

University Education:

2009–20012 Bachelor Degree of Petrochemical and Polymeric Materials, Faculty of Engineering and Industrial Technology, Silpakorn University, Nakornpathom, Thailand

Proceeding:

1. Bunlengsuwan, P.; Sirivat, A.; and Siemanond, K. (2015, April 21) Effect of Sulfonated Graphene Oxide on Sulfonated Polysulfone Membrane for Direct Methanol Fuel cells. Proceedings of the 6th Research Symposium on Petrochemical and Materials Technology and the 21th PPC Symposium on Petroleum, Petrochemicals, and Polymers, Bangkok, Thailand.

Presentation:

1. Bunlengsuwan, P.; Sirivat, A.; and Siemanond, K. (2015, April 21) Effect of Sulfonated Graphene Oxide on Sulfonated Polysulfone Membrane for Direct Methanol Fuel cells. Paper presented at The 6th Research Symposium on Petrochemical and Materials Technology and the 21th PPC Symposium on Petroleum, Petrochemicals, and Polymers, Bangkok, Thailand.
