

CHAPTER VII

EVALUATION OF THE IMPROVEMENT AFTER FMEA IMPLEMENTATION

7.1 Introduction

In this thesis, quality as shipped (QAS) and customer complaint as the indicators for demonstrating the improvement after FMEA implementation. The comparison of QAS between before and after implementation are shown from figure 7.1 to figure 7.35. In August, September and October 1997 are the three months of before implementation. And in April, May and June 1998 are the three months after implementation.

For the improvement on customer complaint items in manufacturing area is shown in figure 7.36 Basically, comparison of customer complaint items in manufacturing area is between before and after FMEA implementation. From April 1997 to October 1997 was the period of before FMEA implementation. From April 1998 to October 1998 was the period of after FMEA implementation.

7.2 Quality as shipped (QAS)

Currently, Molex Thailand use QAS and part per million concept to measure the quality of product before they are shipped to the end customers. For QAS, sampling plan is applied to gather defects of the product in each lot at the final gate which is before packing process, then comparison with the number of detection is considered. For the whole month, Molex Thailand gather all information for both number of defects and number of detection to make a part per million in each month.

For each lot, if it is more than acceptance level at the final gate, Molex Thailand will sort 100% of that batch and then summarize the quantity of defects and then divided by the total number of detection. Molex Thailand use this concept for each type of defect and show in the table and demonstrate as a graph for the whole month as well.

7.3 Comparison QAS between before and after FMEA implementation

In this thesis, QAS comparison before and after FMEA implementation are shown as the following. From Chapter III, there are five part number which are selected to implement FMEA technique and they will be evaluated by using QAS.

7.3.1 Part 889-4941 for wrong color wire be assembled

From figure 7.2 to figure 7.4 show all significant QAS of quality criteria in August, September and October 1997 respectively. This period is before FMEA implementation. From figure 7.5 to figure 7.7 show all significant QAS of quality criteria in April, May and June 1998 respectively which is the period of after FMEA implementation.

In figure 7.1 show the comparison between before and after FMEA implementation in wrong color wire be assembled quality criteria for part 889-4941. Before FMEA implementation, QAS of wrong color wire be assembled are 500 ppm, 533 ppm and 450 ppm in August, September and October 1997 respectively. After FMEA implementation in April, May and June 1998, QAS of wrong color wire be assembled quality criteria are all zero.

7.3.2 Part 889-4859 for wire alternation

From figure 7.9 to figure 7.11 show all significant QAS of quality criteria in August, September and October 1997 respectively. This period is before FMEA implementation. From figure 7.12 to figure 7.14 show all significant QAS of quality criteria in April, May and June 1998 respectively which is the period of after FMEA implementation.

In figure 7.8 show the comparison between before and after FMEA implementation in wire alternation quality criteria for part 889-4859. Before FMEA implementation, QAS of wire alternation are 625 ppm, 500 ppm and 500 ppm in August, September and October 1997 respectively. After FMEA implementation in April, May and June 1998, QAS of wire alternation quality criteria are 200 ppm, 200 ppm and 0 ppm respectively.

Figure 7.28- QAS of all quality criteria in June 1998 for 889-0692

7.3.5 Part 889-4529 for unlocked

From figure 7.30 to figure 7.32 show all significant QAS of quality criteria in August, September and October 1997 respectively. This period is before FMEA implementation. From figure 7.33 to figure 7.35 show all significant QAS of quality criteria in April, May and June 1998 respectively which is the period of after FMEA implementation.

In figure 7.29 show the comparison between before and after FMEA implementation for unlocked quality criteria for part 889-4529. Before FMEA implementation, QAS of unlocked are 600 ppm, 500 ppm and 500 ppm in August, September and October 1997 respectively. After FMEA implementation in April, May and June 1998, QAS of unlocked quality criteria are all zero.

7.4 Comparison customer complaint items in manufacturing area between before and after FMEA implementation

In this thesis, comparison between before and after FMEA implementation of customer complaint items in manufacturing is shown in figure 7.36. In this figure 7.36 show the customer complaint items in manufacturing area in 1997 and 1998.

In table 7.1 show the number of customer complaint items in manufacturing area in April, May, June, July, August, September and October 1997 against 1998 by monthly. In 1997 is the period of before FMEA implementation and in 1998 is the period of after FMEA implementation

Table 7.1- Customer complaint items in manufacturing area in 1997 against 1998

Monthly customer complaint items in manufacturing area	In 1997	In 1998
April	6.0	4.0
May	5.0	3.0
June	3.0	2.0
July	4.0	3.0
August	5.0	2.0
September	5.0	2.0
October	4.0	2.0
Total	32.0	18.0
Average	4.57	2.57
Percentage improvement is 43.76		

Source: The figure of customer complaint items in manufacturing in 1997 and 1998 are shown in Appendix E

สถาบันวิทยบริการ

Improvement on Customer complaints after FMEA implementation

Figure 7.36- Comparison of customer complaint items in manufacturing area between before and after FMEA implementation

7.5 Standard procedure for product quality improvement

After FMEA implementation, FMEA team come out the standard procedure which have been described in seven cases as following

Case I: Standard procedure for setting up crimping machine

This standard procedure help to reduce the following quality criteria

1. Terminal bent
2. Wire is out off housing
3. Unlocked

Case II: Standard procedure for preventive maintenance level II and level III

This standard procedure help to reduce "Unlocked"

Case III: Standard procedure for crimping specification and tolerance analysis

This standard procedure help to reduce "Wire is out off housing"

Case IV: Standard procedure for tighten sampling plan and reduced sampling plan

This standard procedure help to reduce the following quality criteria

1. Wrong wire color be assembled
2. Terminal bent
3. Unlocked

Case V: Standard procedure for continuity test

This standard procedure help to reduce "Wire alternation"

Case VI: Standard procedure for color checker

This standard procedure help to reduce "Wrong wire color be assembled"

Case VII: Standard new carton

This standard procedure help to reduce "Terminal bent"

Case I: Standard procedure for setting up crimping machine

This standard can be applied to crimping process which is described as following.

- 1 Assembly the applicator on the bolster plate and lock by screws
- 2 Put the terminal to guide feed of applicator and lock it
- 3 Turn on power supply 220V and ensure pilot lamp is light
- 4 Start electric motor at output 300W and rotate fly wheel in the direction given by V-belt.
- 5 Push foot switch one time.
- 6 Check the punch, terminal and anvil are aligned
- 7 Insert wire and crimp terminal
- 8 Check with Molex specification. If the crimping is out off specification, turn the locked nut.
- 9 Adjust the crimping height by turning adjust dial with adjust handle 0.03 mm per scale. If crimping height is too low, adjust to the left. If crimping height is too height, adjust to the right
- 10 When crimping is under specification, lock the nut softly and fix screw at position "A" and "B" strongly
- 11 Then fix the locked nut strongly again

Case II: Standard procedure for peventive maintenance of level II and level III

FMEA team review level II and level III of preventive maintenance and come out the criteria which needed to be checked and inspected. Those criteria for both level II and level III of preventive maintenance are shown as following

1 Level II of preventive maintenance

There are five main things that must be checked for level II of preventive maintenance and they are listed out as following

1.1 Swivel arms and Grippes

There are ten things that needed to be inspected

- 1 Swivel cylinder
- 2 Bush holder

- 3 Swivel bush
- 4 Shock absorber
- 5 Rod eyes
- 6 Tie bar bush
- 7 Grooved ball bearings
- 8 Gripper finger
- 9 Lever
- 10 Tension of tooth belt

1.2 Measuring unit and cutter block

There are five things that needed to be checked

- 1 Knock out blades
- 2 Center cutter
- 3 Strippers
- 4 Measuring roller
- 5 Check proper function of piece counter

1.3 Pneumatic unit

There are four things that needed to be checked

- 1 Air regulator at 6 bar
- 2 Lubricator unit (oil level) 1 drop/5min
- 3 Pressure limit switch
- 4 Air filter

1.4 Electric parts

- 1 Clean magnetic contactor
- 2 Clean filter
- 3 Clean relay
- 4 Check all sensor

1.5 Others

- 1 Clean the entire machine
- 2 Lubricate all moving part

2 Level III of preventive maintenance

There are five main things that must be checked for level III of preventive maintenance and they are listed out as following

2.1 Swivel arms and grippers

There are eleven things that needed to be checked

- 1 Dismantle and clean the swivel arms and gripper
- 2 Check bush holder
- 3 Swivel bush
- 4 Shock absorber
- 5 Rod eyes
- 6 Tie bar bush
- 7 Swivel cylinder
- 8 Grooved ball bearings
- 9 Gripper finger
- 10 Lever
- 11 Tension of tooth belt

1.2 Measuring unit and cutter block

There are seven things that needed to be checked

- 1 Knock out blades
- 2 Center cutter
- 3 Strippers
- 4 Measuring roller
- 5 Check proper function of piece counter
- 6 Dismantle and clean the cutter block
- 7 Dismantle and clean measuring unit

1.3 Pneumatic unit

There are four things that needed to be checked

- 1 Air regulator at 6 bar
- 2 Lubricator unit (oil level) 1 drop/5min
- 3 Pressure limit switch
- 4 All control valves

1.4 Electric parts

There are six things that needed to be checked

- 1 Clean magnetic contactor
- 2 Clean filter
- 3 Clean relay
- 4 Check all sensor
- 5 Check carbon bush of the drive motor
- 6 Clean drive motor

1.5 Others

- 1 Clean the entire machine
- 2 Lubricate all moving part

Case III: Standard procedure for crimping specification and tolerance analysis

This analysis can be a guideline to determine new crimping specification of any new terminal of harness wire assembly. Result of this analysis can be able to modify crimping specification when quality problem has been occurred. This analysis is to enhance determination of customer specification.

1 Crimp specification

There are two parts that needed to be analyzed for crimping specification. Firstly, it is the strip length and secondly, it is crimp height. Figure 7.37 show the picture of stripped wire and crimped wire.

Figure 7.37- Stripped wire and crimped wire

1.1 Strip length for crimping terminal

In figure 7.37 show the picture of stripped wire.

1.1.1 Criteria that needed to be considered

1 Extrude wire from conductor barrel

2 Position of insulation end between conductor barrel and insulator barrel

1.1.2 Define the nominal strip length which considered from insulation end point. This end point should be located in the middle between conductor and insulator barrel. And the end of extrude wire should be in the middle between conductor barrel and end of mating zone. In figure 7.38 shows the position of insulation end and the position of extrude wire. In this figure 7.38 show the improperly crimped wire

1.1.3 Define the strip length's tolerance. Consideration of the range between conductor and insulator barrel is a must.

1.1.4 Cut and strip the wire according to the dimension and tolerance which was set in step 1.1.3 and 1.1.4 by using the upper limit number and lower limit number and then verify the strip length by practical crimping with wire so as to be able to adjust the tolerance again.

Figure 7.38- Example of improperly crimped wire

1.2 Crimp height

There are two type of improperly crimped wire.

1.2.1 Conductor crimped height

1 To evaluate the conductor crimp height, it is needed to refer to crimp strength of the terminal which has the same specification. For board-in terminal, it is needed to consider PCB hole as well because PCB hole is a part to limit the crimp height.

2 Prepare strip wire and then crimp the wire with different crimp height to test the crimp strength. Result of that the upper and lower specification of crimping specification can be identified.

3 After getting the middle value of crimp height, do insert into housing or print circuit assembly board (PCB) to test quality criteria.

1.2.2 Insulator crimped height

1 To evaluate insulator crimp height, type of wire and its application are the major thing to be considered. For example, UL 1015 has double insulator. UL 1617 is thicker than UL 1007. See figure 7.39. The thickness of insulator will limit the tolerance of insulator crimp height. In figure 7.39 show the cross section of wire and show the good crimped wire and bad crimped wire.

Figure 7.39- Insulator barrel cross section

2 To verify defined insulator crimp height specification, do adjust the tooling by using sample of crimped wire as an signal to adjust. Figure 7.40 show the maximum insulator crimp height and minimum insulator crimp height.

Figure 7.40- Insulator barrel cross section

3 After define insulator crimp height specification, do insert into housing or PCB to conform final specification or customer specification.

1.3 Analysis wire length's tolerance

There are two parts to be considered

1.3.1 Check the capability of cutting machine whether to be able to meet customer required specification or not

1.3.2 Consider the tolerance of the customer requirement specification and split the assembled part into components and add the tolerance of all components which has the same direction as follow

- 1 Crimping position tolerance
- 2 Strip length tolerance
- 3 Cut wire tolerance

When measure the wire length after insertion into housing, the wire need to be pulled a bit to get the lance hit the locking lance in the housing, so this tolerance will not be considered.

Case IV: Standard procedure for tighten sampling plan and reduced sampling plan

Samples must be taken randomly from the submitted lot according to the C=0 sampling plans with switching rule. Whenever the sampling plan was done and found only one reject part, Molex Thailand will reject the whole lot and Molex Thailand will sort the whole lot in house before that lot be shipped to customer.

1 The starting inspection point for any part number is normal level at AQL = 0.1 with C=0. See table 5.1 for sampling plan with C=0

2 Condition for normal level (AQL = 0.40 with C=0) to reduced level (AQL = 0.10 with C=0) This will be effective when the bellowing condition is exist.

2.1 Five consecutive lots are accepted

3 Condition for reduced level (AQL = 0.4 with C=0) to normal level (AQL = 0.1 with C=0) This will be effective when any one of the bellowing condition is exist.

3.1 Any lot was rejected

3.2 Irregular production

For example, there is no production in the last 10 consecutive working days

3.3 After ten lots was inspected

4 Condition for normal level (AQL = 0.1 with C=0) to tightened level (AQL = 0.04 with C=0) This will be effective when the bellowing condition is exist

4.1 Two of five consecutive lots was rejected

5 Condition for tightened level (AQL = 0.01 with C=0) to Normal level (AQL = 0.1 with C=0) This will be effective when the bellowing condition is exist

5.1 Five consecutive lots accepted

Case V: Standard procedure for continuity test

1 Choose the suitable continuity tester for the harness which will be tested

2 Connect the chosen continuity tester to power supply and check its function. This is to make sure that it is functional

3 Connect one end of harness with the mating connector and do the same thing with another end of harness

4 If the signal is active, that harness wire is accepted. But if the signal is not active, that harness will be rejected that needed to be reworked

Case VI: Standard procedure for color cable checker

1 Turn on color cable checker

2 Wait five minutes

3 Set number of wire to be checked

4 Press reset bottom

5 Press clear bottom to clear memory

6 Slide wire to the guide

7 Check the result with table 7.2

8 If the reject was found, it will has sound. Press reset bottom to stop that sound

9 When checking is completed as much as assigned , there will be Beep Beep sound

Table 7.2- Result of checking

Result	Light signal	Sound	Counter
accept	Green	Beep sound three times	auto count
reject color orientation	Red	Continue Beep sound high frequency	press reset
reject no of wire	Red	Continue Boo sound low frequency	press reset
Speed error for both good and defect part	Yellow	Continue Boo sound	press reset

Case VII: Standard new carton

Molex Thailand change the thickness of carton from three layers to five layers which are shown in figure 7.41 and 7.42 respectively

**Figure 7.41- 3 layers carton**

Figure 7.42- 5 layers carton
