CEPHALEXIN

(Griffith and Black, 1968 ; Budavari, 1989 ; Gerald, 1992 ; Reynolds, 1993)

Cephalexin was first developed by Glaxo Co. Ltd.. Cephalexin was modified from cephaloglycin in which the acetoxy group was replaced by a simple hydrogen atom, gave a compound with improved oral absorption and better stability characteristics. Cephalexin is the one of the cephalosporin which is absorbed to the greatest extent after oral administration whilst retaining broad spectrum antibacterial activity.

Formula

Molecular formula

Molecular weight

347.40

Chemical name

7-[(Aminophenyl acetyl) amino]-3-methyl-8-oxo-5-thia-1-azabicyclo [4.2.0] oct-2-ene-2-carboxylic acid monohydrate.

Appearance

Cephalexin occurs as a white to off-white, crystalline powder with a faint characteristic odour.

Solubility

Cephalexin is slightly soluble in water, which is 1 g in 100 g of water, practically insoluble in alcohol, chloroform and ether.

Dissociation constant

$pK_{a_1} = 5.2$, $pK_{a_2} = 7.3$

Stability

Cephalexin should be stored in tight container at a temperature less than 40°C , preferably between $15\text{-}30^{\circ}\text{C}$.

Pharmacological action

Cephalexin, like other cephalosporins, is usually bactericidal in action. The antibacterial activity results from 1-oxa- β -lactams and cephemycin inhibit the mucopeptide synthesis in the bacterial cell wall. Although the exact mechanisms of action have not been fully elucidated, β -lactam antibiotics bind to several enzymes in the bacterial cytoplasmic membrane (e.g., carboxypeptidase, endopeptidase, and transpeptidases) that are involved in cell-wall synthesis and cell division. It has been hypothesized that β -lactam antibiotics act as substrate analogs of acyl-D-alanyl-D-

alanine, the usual substrate for these enzymes. This interferes with cell wall synthesis and results in the formation of defective cell walls and osmotically unstable spheroplasts. Cell death following exposure to β -lactam antibiotics usually results from lysis, which appears to be mediated by bacterial autolysins such as peptidoglycan hydrolases.

The target enzymes of β -lactam antibiotics have been classified as penicillin-binding proteins (PBPs) and appear to vary substantially among bacterial species. The affinities of various β -lactam antibiotics for different PBPs appear to explain the differences in morphology that occur in susceptible organisms following exposure to different β -lactam antibiotics and may also explain differences in the spectrum of activity of β -lactam antibiotics that are not caused by the presence or absence of β -lactamases.

Spectrum of Action

Cephalexin is classified as a first generation cephalosporin. Like other first generation cephalosporins, cephalexin is active against many gram positive aerobic cocci but has limited activity against gram negative bacteria. Cephalexin is usually active against both penicillinase-producing and nonpenicillinase-producing gram positive cocci such as *S.aureus* and *S.epidermidis*; group A β -hemolytic streptococci (*Streptococcus pyogenes*); group B Streptococci (*S.agalactiae*); and *S. pneumoniae*. *Proteus* and *Shigella* may be inhibited by drug. Cephalexin is inactive against enterococci, methicillin-resistant staphylococci and others *Proteus*.

Pharmacokinetics

Cephalexin monohydrate is acid-stable and is rapidly and completely absorbed from the GI tract. Following oral administration of cephalexin in healthy, fasting adults

with normal renal function, peak serum cephalexin concentrations are attained within 1 hour and average 9 µg/ml following a single 250-mg dose, 15-18 µg/ml following a single 500-mg dose, and 32-39 µg/ml following a single 1-g dose. Peak serum concentration are slightly lower and are attained later when cephalexin is administered with food, although the total amount of drug absorbed is unchanged. Following oral administration of cephalexin in fasting, healthy adults, serum concentrations 15 and 30 minutes after a single 500 mg dose averaged about 0.2 and 12 µg/ml, respectively. Absorption of cephalexin is delayed in young children and may be decreased up to 50% in neonates. Peak serum concentrations of the drug have been reported to occur within 3 hours in infants younger than 6 months of age, within 2 hours in children 9-12 months of age, and within 1 hour in older children.

Following absorption, cephalexin is widely distributed to tissues and fluids including pleural fluid, synovial fluid, and bone. Cephalexin readily cross the placenta, and fetal serum concentrations may be 10% or more of maternal serum concentrations. Cephalexin is distributed in low concentrations into milk. An approximate degrees of protein binding is 6-15%. The serum half-life of cephalexin is 0.5-1.2 hours in adults with normal renal function.

Cephalexin is excreted unchanged in urine. More than 90% of a single 250-or 500-mg oral dose is excreted within 8 hours in adults with normal renal function. Cephalexin concentrations of 0.11-4 mg/ml have been reported in urine collected over a 6-hour period following a single 500-mg dose in adults with normal renal function. Peak urine concentrations of the drug averaging about 2 mg/ml occur 2 hours after a single 500-mg oral dose of cephalexin.

Administration

Cephalexin are administered orally.

Dosage

The usual adult dosage of cephalexin is 250 mg every 6 hours. For streptococcal pharyngitis, skin and skin structure infections, or uncomplicated cystitis in patients older than 15 years ago, 500 mg of cephalexin may be given every 12 hours. Therapy of cystitis should be continued for 7-14 days. For severe infections of those caused by less susceptible organism, higher dosages may be needed (up to 4 g daily in adults). The usual dosage of cephalexin for children is 25-50 mg/kg daily.

ETHYLCELLULOSE

(Steuernagel, 1989 ; Gennaro, 1990)

Ethylcellulose represents one of a small number of approved polymers available for pharmaceutical applications. Ethylcellulose is probably the most widely used water-insoluble polymer in film coating due to its good film-forming properties that enable tough, flexible coatings to be produced. Ethylcellulose is a cellulose ether made by the reaction of ethyl chloride with alkali cellulose.

Formula

$$R = \text{CH}_3\text{CH}_2$$

Molecular Formula

$$R (\text{OH})(\text{OC}_2\text{H}_2)_n$$

Molecular weight

$$\sim 100,000$$

Chemical name

cellulose ethyl ether

Appearance

Free flowing, white to light tan powder is occurred.

Solubility

The medium type is freely soluble in tetrahydrofuran, methyl acetate, chloroform or mixtures of aromatic hydrocarbons with alcohol ; the standard type is freely soluble in alcohol, methanol, toluene, chloroform or ethyl acetate ; both types are insoluble in water, glycerin or propylene glycol.

Melting point

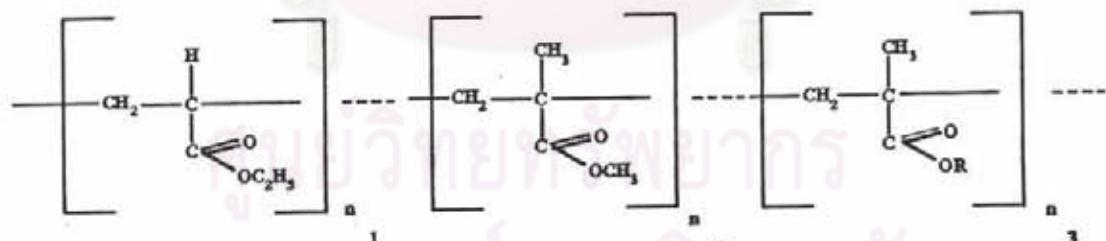

140°C

EUDRAGIT RL 100[®] and RS 100[®]

(Lehmann, 1989)

Eudragit RL and RS are copolymers synthesized from acrylic and methacrylic acid esters with a low content of quaternary ammonium groups. The ammonium groups are present as salts and give rise to the permeability of the films. The distinguishing letters RL and RS relate to the initial letters of the German words "leichtdurchlassing" (freely permeable) and "schwerdurchlassing" (slightly permeable) respectively and refer to the permeability characteristics of these coating agents throughout entire digestive tract. They are mainly used in the production of orally administered pharmaceutical dosage forms, particularly tablets, pills, pellets and granules, with delayed drug release properties so called depot or retard preparations.

Formula

Eudragit RL 100[®] n₁ : n₂ : n₃ = 1 : 2 : 0.2

Eudragit RS 100[®] n₁ : n₂ : n₃ = 1 : 2 : 0.1

Molecular weight

150,000

Chemical name

Ammonio Methacrylate copolymer, Type A (Eudragit RL) and Type B (Eudragit RS)

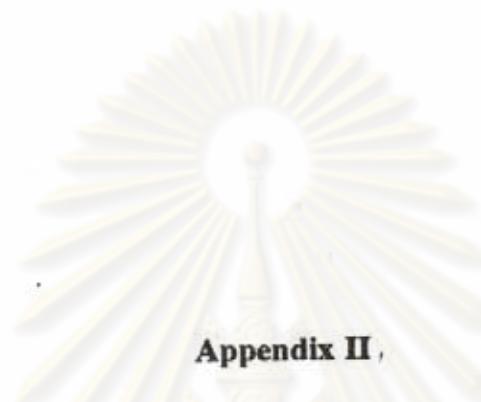

Appearance

Solid in the form of white opaque granules with a slight amine-like odour.

Solubility

Eudragit RL and RS are insoluble in water and digestive fluids, but are capable of swelling and are permeable. In other solvents, 1 g of dry Eudragit dissolves in 7 g of methanol, ethanol and isopropanol containing small amounts of water or in acetone, ethyl acetate and methylene chloride to give clear to slightly opalescent solutions. The dry substances are practically insoluble in petroleum ether and 1 N sodium hydroxide.

Particle size distribution data of 2:3 ERL:RS microcapsules

prepared by coacervation technique, core : wall ratio 1:2.

Particle size range	mean size (micron)	n	%n	cumulative of %n
< 2	-	0	0	0
2 - 22	12	88	14.08	14.08
22 - 42	32	249	39.84	53.92
42 - 62	52	200	32.00	85.92
62 - 82	72	64	10.24	96.16
82 - 102	92	24	3.84	100.00
Total	-	625	100.00	100.00

ศูนย์วิทยาศาสตร์
จุฬาลงกรณ์มหาวิทยาลัย

Cumulative size frequency curves of microcapsules prepared by spray drying technique using 2:3 ERL:RS as wall material.

core:wall

- ratio 2:1 mean = 39.84, median = 30.
- △— ratio 1:1 mean = 40.51, median = 32.
- ◆— ratio 1:2 mean = 41.98, median = 32.

HPLC Chromatogram

ศูนย์วิทยทรัพยากร
จุฬาลงกรณ์มหาวิทยาลัย

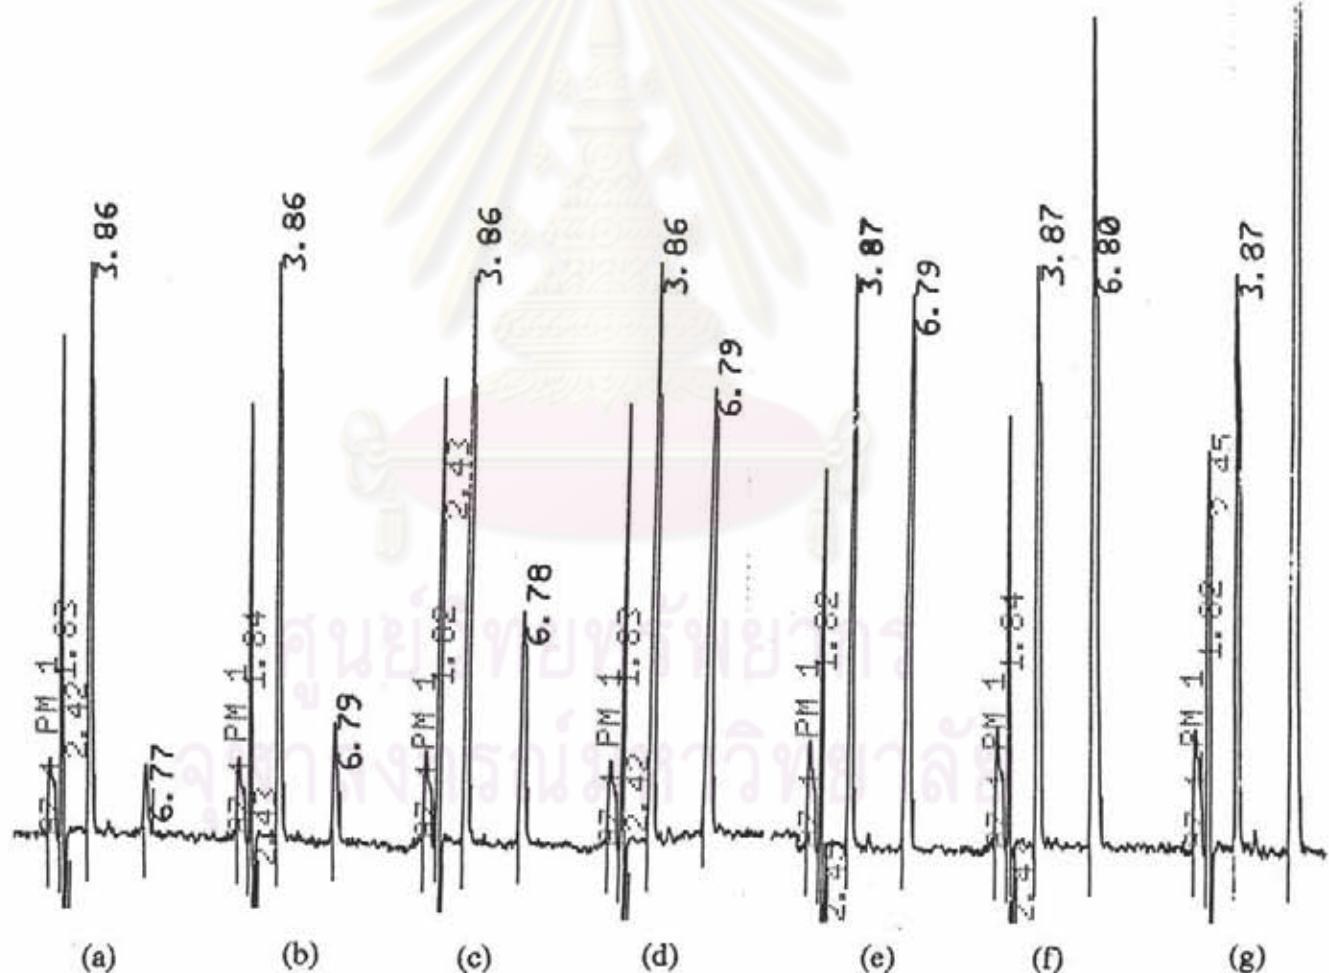

Fig. 136 : HPLC chromatogram of cephalexin standard curve at UV 262 nm,

(a) 0.1 $\mu\text{g/ml}$, (b) 0.2 $\mu\text{g/ml}$, (c) 0.4 $\mu\text{g/ml}$, (d) 0.8 $\mu\text{g/ml}$,

(e) 1.0 $\mu\text{g/ml}$, (f) 1.5 $\mu\text{g/ml}$, (g) 2.5 $\mu\text{g/ml}$.

Retention time of pyrazinamide is 3.86 min (internal standard)

Retention time of cephalexin is 6.79 min.
