APPENDICES

Appendix A Dissolution Rate

The effluent, from the test section, was collected every 30 minutes and it was analyzed with AAS for the calcium concentration. The samples were diluted 20 times to fit AAS limitation. Scallop characteristics were obtained by taking photos every 30 minutes. Thickness of plaster pipe was measured every centimeter along the pipe and calculated to get the dissolution rate profile along the pipe at the end of the test. Moreover, pressure drop was also measured every 30 minutes between the inlet and outlet of the conduit by pressure transducer.

A.1 Dissolution Rate with Time

A.1.1 *Effect of Flow Rate*

Figure A.1 Dissolution rate with time at pH7 and 30°C.

Figure A.2 Dissolution rate with time at pH10 and 30°C.

A.1.2 Effect of Defect Size

Figure A.3 Dissolution rate with time at different sizes of particles, 25°C, 100 defects/cm³ and 25LPM.

Figure A.4 Dissolution rate with time at different sizes of particles, 25°C, 100 defects/cm³ and 35LPM.

Table A.1 Average dissolution rate calculating from AAS at different sizes of initial defects and 25 LPM.

t (min)	Pure Plaster	0.21-0.25 mm 100 defects/cm ³	0.42-0.50 mm 100 defects/cm ³	0.500-0.707 mm 100 defects/cm ³

Figure C.19 The overall rate constant (K) and the dissolution coefficient (k_d) compared with the mass transfer coefficient (k_m) along the pipe length under condition 0.21-0.25 mm, 50 defects/cm^3 , 10°C and 35 LPM.

Figure C.20 The overall rate constant (K) and the dissolution coefficient (k_d) compared with the mass transfer coefficient (k_m) along the pipe length under condition 0.21-0.25 mm, 100 defects/cm³, 10°C and 35 LPM.

Figure C.21 The overall rate constant (K) and the dissolution coefficient (k_d) compared with the mass transfer coefficient (k_m) along the pipe length under condition 0.42-0.50 mm, 50 defects/cm³, 10°C and 35 LPM.

Figure C.22 The overall rate constant (K) and the dissolution coefficient (k_d) compared with the mass transfer coefficient (k_m) along the pipe length under condition 0.42-0.50 mm, 100 defects/cm³, 10°C and 35LPM.

Figure C.23 The overall rate constant (K) and the dissolution coefficient (k_d) compared with the mass transfer coefficient (k_m) along the pipe length under condition 0.500-0.707 mm, 50 defects/cm³, 10°C and 35LPM.

Figure C.24 Mass The overall rate constant (K) and the dissolution coefficient (k_d) compared with the mass transfer coefficient (k_m) along the pipe length under condition 0.500-0.707 mm, 100 defects/cm³, 10°C and 35LPM

CURRICULUM VITAE

Name: Ms. Pasit Warunphaisal

Date of Birth: April 17, 1984

Nationality: Thai

University Education:

2002-2005 Bachelor Degree of Chemical Engineering, Faculty of Engineering, Thammasat University, Bangkok, Thailand

Working Experience:

2006-2007 Position: Process Engineer

Company name: HOYA LENS (Thailand) Co, ltd.

Proceedings:

Warunphaisal P., and Derek H. Lister (2009, April 22) Surface Dissolution and Formation of Scallops. Proceedings of 15th PPC Symposium on Petroleum, Petrochems, and Polymers, Bangkok, Thailand.

Presentations:

1. Warunphaisal P., and Rirksomboon T (2009, April 22) Surface Dissolution and Formation of Scallops. Poster presented at the 15th PPC Symposium on Petroleum, Petrochems, and Polymers, Bangkok, Thailand.
