APPENDICES

Appendix A Identification of Characteristic FT-IR Spectrum of 3-Thiophene Acetic Acid, Poly(3-thiophene methyl acetate), Undoped Poly(3-thiophene acetic acid), Acrylonitrile-butadiene Rubber, and P3TAA/NBR Blends

The poly(3-thiophene acetic acid) (P3TAA) was first characterized by FT-IR spectroscopy in order to identify functional groups. Fourier Transform Infrared Spectrometer (Thermo Nicolet, Nexus 670) operated in the absorption mode with 32 scans and a resolution of 4 cm^{-1} , covering a wavenumber range of $4000\text{-}400\text{ cm}^{-1}$ using a deuterated triglycine sulfate detector. Optical grade KBr (Carlo Erba Reagent) was used as the background material. The synthesized PTAA was intimately mixed with dried KBr at a ratio of P3TAA: KBr = 1:20.

Figure A1 The FT-IR spectrum of: a) monomer; 3-thiophene acetic acid (TAA); b) Poly(3-thiophene methyl acetate)(P3TMA); and (c) Poly(3-thiophene acetic acid) (P3TAA).

The assignments of peaks in the spectrum are shown in Table A1. The characteristic peaks of PTAA were found at $3200\text{-}3000\text{ cm}^{-1}$ assignable to the stretching vibration of the C-H bond on the thiophene ring; at $3000\text{-}2800\text{ cm}^{-1}$, they

represent the aliphatic C-H bonds; at 1700 cm^{-1} , the C=O stretching vibration; at 1400 cm^{-1} , the thiophene ring stretching vibration; and at $1300\text{-}1200\text{ cm}^{-1}$, the C-O stretching vibration. The most characteristic feature in this spectrum is the extremely broad O-H absorption occurring in the region from $3400\text{ to }2400\text{ cm}^{-1}$, which is attributed to the strong hydrogen bonding of the dimer. This absorption often obscures the C-H stretching vibrations that occur in the same region. It is obvious from the absorption peak at around 1700 cm^{-1} that the ester groups were not deteriorated during the oxidative polymerization (Kim *et al.*, 1999). The FT-IR spectrum of Poly(3-thiophenemethyl acetate);PTMA, shown at $3000\text{-}2800\text{ cm}^{-1}$ assigned to the stretching vibration of the C-H band on the thiophene ring. Absorption band at $1735\text{-}1750\text{ cm}^{-1}$ for the C=O stretching vibrations; at 1432 cm^{-1} for thiophene ring stretching vibration and at $1300\text{-}1200\text{ cm}^{-1}$ for C-O stretching vibrations. Therefore, the oxidative polymerization of 3-thiophane methyl acetate is confirmed (Senadeera, 2005).

Table A1 The FT-IR absorption spectrum of undoped and doped P3TAA

Wavenumber (cm^{-1})	Assignments	References
$3400\text{-}2400 \pm 20$ [3400-2400]	O-H stretching vibration	Kim <i>et al.</i> (1999)
3100 ± 50 [3200 – 3000]	C-H stretching of thiophene ring	Kim <i>et al.</i> (1999)
2910 ± 10 [3000 – 2800]	C-H stretching of aliphatic	Kim <i>et al.</i> (1999)
1710 ± 10 [1700]	C=O stretching vibration	Kim <i>et al.</i> (1999)
1399 ± 5 [1400]	Thiophene ring stretching vibration	Kim <i>et al.</i> (1999)
1300 ± 5 1300 - 1200	C-O stretching vibration	Kim <i>et al.</i> (1999)

For Acrylonitrile butadiene rubber, were characterized in order to identify their structures in different types. FT-IR spectrometer Fourier transform (Thermo Nicolet, Nexus 670) operated in the absorption mode with 32 scans and a resolution of $\pm 4 \text{ cm}^{-1}$, covering a wavenumber range of $4000\text{-}400 \text{ cm}^{-1}$ using a deuterated triglycine sulfate detector. A Horizontal Attenuated Total Reflectance accessory (HATR) with equipped with ZnSe was used. The characteristic peaks of Acrylonitrile butadiene rubber were found at $2850\text{-}3300 \text{ cm}^{-1}$ assignable to the stretching vibration of the C-H bond. The characteristic absorptions at 2237 cm^{-1} (C \equiv N stretching), 1630 cm^{-1} (C=C stretching) and $1440\text{-}1445 \text{ cm}^{-1}$ is out of plane C-H wagging (Yong, *et al.*, 2006).

Figure A2 The FT-IR spectrum of: a) NBR1; b) NBR2; c) NBR3; d) NBR4 and e) NBR5.

Table A2 Summarized of FT-IR absorption spectrum at 2237 cm^{-1} ($-\text{C}\equiv\text{N}$)

Grade	Type	Bound acrylonitrile (%)	FTIR band intensity ratio
DN101L	NBR1	42.30	47%
Krynac3345 F	NBR2	33.00	23%
DN2850	NBR3	28.00	20%
DN401L	NBR4	18.50	13%
KrynacX7.50	NBR5	26.50	20%

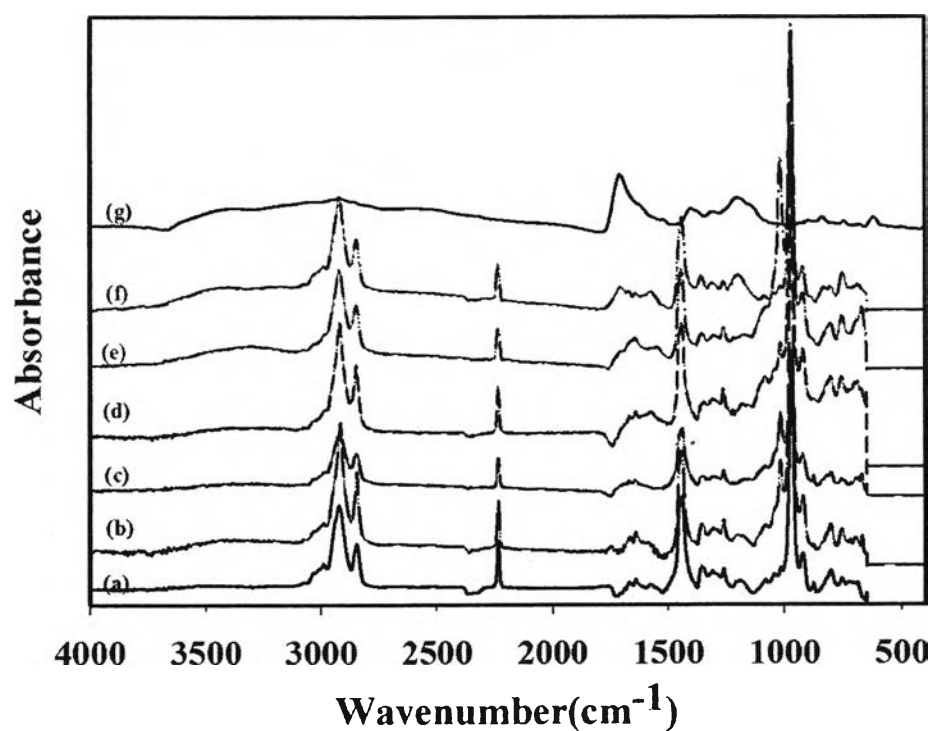

Figure A3 The FT-IR spectrum of: a) pure NBR1; b) P3TAA_5/NBR1; c) P3TAA_10/NBR1; d) P3TAA_15/NBR1; e) P3TAA_20/NBR1; f) P3TAA_30/NBR1 g) pure P3TAA.

Poly(3-thiopheneacetic acid)/Acrylonitrile butadiene rubber, P3TAA/NBR, blends were characterized by using FT-IR spectrometer Fourier transform (Thermo

Nicolet, Nexus 670) operated in the absorption mode with 32 scans and a resolution of $\pm 4 \text{ cm}^{-1}$, covering a wavenumber range of $4000\text{-}400 \text{ cm}^{-1}$ using a deuterated triglycine sulfate detector. A Horizontal Attenuated Total Reflectance accessory (HATR) with equipped with ZnSe was used. The results showed the position wavenumber of the blends that were combined between NBR and P3TAA. When P3TAA were added to NBR matrix the wavenumber around 3400 cm^{-1} which represent -OH group of poly(3-thiopheneacetic acid) were detected at the blend films. The absorbance of this wavenumber was higher in the blends having high P3TAA composition.

Appendix B Identification of Characteristic of Proton Nuclear Magnetic Resonance ($^1\text{H-NMR}$)

Proton Nuclear Magnetic Resonance ($^1\text{H-NMR}$) Varian Unity Inova was used to identify our successful synthesis of poly (3-thiopheneacetic acid). The different characteristic peaks of both polythiophene derivatives are shown in the figures B1 and B2.

Figure B1 $^1\text{H-NMR}$ characteristic peaks of poly(3-thiophenemethyl acetate).

Figure B2 $^1\text{H-NMR}$ characteristic peaks of poly(3-thiophene acetic acid).

$^1\text{H-NMR}$ spectra of these polymers were in agreement with their expected structures: P3TMA (Figure 4.6) δ 7.26-7.3 ppm (m, thiophene ring proton, 1H), 3.68 ppm (s, thiophene ring $-\text{CH}_2-$, 2H), 3.66 ppm (s, $-\text{CH}_3$, 3H). P3TAA (Figure 4.7), (DMSO) 12.60 ppm (s, $-\text{COOH}$, 1H), 7.55-7.28 ppm (m, thiophene ring proton, 1H), 3.80-3.37 ppm (m, thiophene ring $-\text{CH}_2-$, 2H). The position at 12.6 ppm is the important feature peak of poly(3-thiopheneacetic acid) in order to identify that the structure can be changed from poly(3-thiophene methyl acetate) to poly(3-thiopheneacetic acid) because this peak disappears in case of poly(3-thiophene methyl acetate) (Kim, *et al.*, 1999).

Appendix C Identification of Characteristic Peaks of Undoped Poly (3-thiophene acetic acid) from UV-Visible Spectroscopy

The UV-Visible spectra of undoped polythiophene recorded with a UV-Vis absorption spectrometer (Perkin-Elmer, Lambda 10). Measurements were taken in the absorbance mode in the wavelength range of 200-800 nm. Synthesized PTAA was grinded into a fine powder, dissolved in DMSO at the concentration of 6.0×10^{-5} M and pipetted into the sample holder. Scan speed was 240 mm/min, and a slit width of 2.0 nm using a deuterium lamp as the light source.

Figure C1 The UV-Visible spectra of; a) undoped poly(3-thiophene acetic acid).

Appendix D The Thermogravimetric Thermogram of Undoped poly(3-thiophene acetic acid) and Acrylonitrile-butadiene Rubber

A thermal gravimetric analyzer (DuPont, model TGA 2950) was used to determine amount decomposition temperature of undoped poly(3-thiophene acetic acid) (P3TAA) and Acrylonitrile butadiene rubber. The temperature scans from 30 to 800°C with a heating rate of 10°C/min. The samples were weighted in the range of 5-10 mg and loaded into a platinum pan, and then heated it under an air flow. Three transitions were observed in undoped poly(3-thiophene acetic acid), 30-120°C, 120-280°C and 280-600°C; they refer to the losses of water and residue solvent, side chain degradation and backbone degradation, respectively (Chotpattananont *et al.*, 2004).

Figure D1 The TGA thermogram of undoped P3TAA under air flow, heating rate 10°C/min.

Table D1 Summary of undoped PTAA degradation steps under air flow

Sample	Transition temperature (°C)			% Weight loss			% Residue
	1 st	2 nd	3 rd	1 st	2 nd	3 rd	
Pth_U under air	30-130	130-350	350-650	7.01	25.23	14	53.76

When temperature was scanned from 30 to 800°C with a heating rate of 10°C/min and the samples were weighted in the range of 5-10 mg and loaded into a platinum pan. It was heated under nitrogen gas flow by using Thermogravimetric/differential thermal analyzer (Perkin Elmer, Pyris Diamond). Three transitions were observed in undoped poly(3-thiophene acetic acid), 30-120°C, 120-300 °C and 450-650°C, respectively.

**Figure D2** The TGA thermogram of undoped P3TAA under nitrogen flow, heating rate 10°C/min.

Table D2 Summary of undoped PTAA degradation steps under nitrogen flow

Sample	Transition temperature (°C)			% Weight loss		
	1 st	2 nd	3 rd	1 st	2 nd	3 rd
Pth_U under Nitrogen gas	30-130	150-330	330-620	7.012	23.27	12.840

For Acrylonitrile butadiene rubber the composites have a better thermal stability. When temperature was scanned from 30 to 800°C with a heating rate of 10°C/min under nitrogen gas and the samples were weighted in the range of 5-10 mg and loaded into a platinum pan. They were heated under nitrogen gas flow. The main transition temperature starts at 415 °C lead to weight loss of 79.84% and completed at 505 °C (George, *et al.*, 2000).

**Figure D3** The TGA thermogram of Acrylonitrile butadiene rubber under nitrogen flow, heating rate 10°C/min.

Figure D4 The TGA thermogram of Acrylonitrile butadiene rubber (NBR1) and Poly(3-thiopheneacetic acid)/Acrylonitrile rubber blends under nitrogen flow, heating rate $10^{\circ}\text{C}/\text{min}$.

Poly(3-thiopheneacetic acid)/Acrylonitrile butadiene rubber, P3TAA/NBR, blends were characterized by using Thermogravimetric/differential thermal analyzer (Perkin Elmer, Pyris Diamond) with a heating rate of $10^{\circ}\text{C}/\text{min}$ from 30 to 800°C under nitrogen gas. At lower concentration of P3TAA, the thermogram of the blend tend to be the same characteristic as pure NBR having a main decomposition temperature around 400°C . When P3TAA were more added to NBR the thermogram of the blended sample showed decomposition temperature around 230°C being the decomposition temperature of side chain of P3TAA. When the blends were added more P3TAA the thermogram have the decomposition temperature in between P3TAA and NBR.

Appendix E Conductivity Measurement

The conductivity of matrixes can be measure by using the resistivity testing fixture (Keithley, Model 8009) connected to a source meter (Keithley, Model 6517A) for a constant voltage source and reading resultant current under the atmospheric pressure, 54-60% relative humidity and 24-25°C. The volume resistivity (ρ_v) of matrixes can calculate by following the ASTM standard D257:

$$\rho_v = \frac{K_v}{t} R \quad (D.1)$$

where R is the volume resistance is ohms.

t is the average thickness of the sample.

K_v is the effective area of the guarded electrode for the particular electrode arrangement employed.

For the Model 8009, which uses circular electrodes, K_v is calculated as follows:

$$K_v = \pi \left(\frac{D\phi}{2} + \beta \frac{g}{2} \right)^2 \quad (D.2)$$

$D\phi$ is the effective diameter of the guarded electroded (5.40 cm or 2 1/8 in).

β is the effective area coefficient (typically zero).

g is the distance between the guarded electroded and the ring electrode(1/8 in.).

When $\beta = \emptyset$, the K_v calculation is simplified as follows:

$$K_v = \pi \frac{(D\phi)^2}{4} \quad (D.3)$$

Thus,

$$K_v = \pi \frac{(5.40)^2}{4} = 22.9 \text{ cm}^2 \quad (D.4)$$

or

$$K_v = \pi \frac{(2.125)^2}{4} = 3.55 \text{ in}^2 \quad (\text{D.5})$$

By using calculated values for K_v , D.1 then becomes:

$$\rho_v = \frac{22.9}{t_c} R \quad (\text{D.6})$$

or

$$\rho_v = \frac{3.55}{t_i} R \quad (\text{D.7})$$

where ρ_v is the volume resistivity.

t_c is the average thickness of the sample in centimeters.

t_i is the average thickness of the sample in inches.

The applied voltage and the current change in the linear ohmic regime were converted to the electrical conductivity of the polymer by using equation (D.8) as follows:

$$\sigma = \frac{1}{\rho} = \frac{1}{R_s \times t} = \frac{I}{K \times V \times t} \quad (\text{D.8})$$

Therefore, the electrical conductivity:

$$\sigma = \frac{1}{\rho_v} = \frac{t_c}{22.9R} = \frac{t_c \times I}{22.9 \times V} \quad (\text{D.9})$$

Where: σ is specific conductivity (S/cm)

t_c is the average thickness of the sample in centimeters

I is the measure current (A)

V is applied voltage (voltage drop) (V)

Table E1 Determination the specific conductivity (S/cm) of Acrylonitrile butadiene rubber

Sample	Conductivity (S/cm)			
	1	2	Average	std
NBR1	3.858E-10	2.768E-10	3.3132E-10	7.709E-11
NBR2	2.819E-10	4.003E-10	3.4108E-10	8.373E-11
NBR3	1.196E-10	3.490E-10	2.3426E-10	1.622E-10
NBR4	1.476E-10	1.152E-10	1.3136E-10	2.291E-11
NBR5	4.299E-10	4.386E-10	4.3424E-10	6.177E-12

From conductivity results, pure NBR rubbers have the electrical conductivity around 10^{-10} S/cm. When undoped P3TAA particles were added to NBR, the conductivity slightly increase around one order magnitude.

Appendix F Scanning Electron Micrograph of Undoped PTAA

Scanning electron microscope (JOEL, model JSM-5200-2AE) was used to determine the morphological structure of the synthesized polymers.

Figure F1 SEM photographs of undoped poly(3-thiopheneacetic acid) at magnification: (a)1000; (b)2000.

From the SEM figures, the particle size of P3TAA is around 20 μm. The size of undoped polymers was supported with the results from particle size analyzer from table G1.

From figure E2, the cross cut P3TAA_20/NBR1 sample was checked dispersion of P3TAA in NBR matrix. Figure F2 (b), the sample was extracted the P3TAA particles out of NBR matrix by using pure DMSO to observe dispersion of the particles.

Figure F2 SEM photographs of P3TAA_20/NBR1 blends at magnification 150: (a) cross cut P3TAA_20/NBR1; (b) extracted P3TAA_20/NBR1 with DMSO.

Figure F3 SEM photographs of P3TAA/NBR1 blends at magnification 500: (a) P3TAA_5/NBR1; (b) P3TAA_10/NBR1; (c) P3TAA_20/NBR1; (d) P3TAA_30/NBR1.

Appendix G Determination of Particle Sizes of Undoped and Doped P3TAA**Table G1** Summarized the particles diameter of undoped P3TAA (Pth_U)

Samples	Particle diameter (mm)				
	1	2	3	Avg.	STD
P3TAA	25.03	24.93	25.19	25.05	0.131

Table G2 The raw data from particle size analysis of undoped P3TAA

Size		Polythiophene					
Low (μm)	High (μm)	1		2		3

Appendix H Electrorheological Properties and Dielectric Properties Measurement of Pure Acrylonitrile-butadiene Rubber and Poly(3-thiopheneacetic acid)/ Acrylonitrile-butadiene Rubber Blend

The electrorheological properties of pure Acrylonitrile butadiene rubber were measured by the melt rheometer (Rheometric Scientific, ARES) under oscillatory shear mode and applied electric field strength varying from 0 to 2 kV/mm. In these experiments, the dynamic moduli (G' and G'') were measured as functions of frequency and electric field strength. Strain sweep tests were first carried out to determine the suitable strain to measure G' and G'' in the linear viscoelastic regime. As the figure H1 was shown, the linear regime when without electric field was 0.1 % strain.

Figure H1 Strain sweep tests of pure acrylonitrile-butadiene rubber (NBR1), frequency 1.0 rad/s, temperature 27 ± 0.5 °C, gap = 0.981 mm at: (a) $E = 0$ kV/mm; (b) $E = 2$ kV/mm.

(a)

(b)

Figure H2 Strain sweep tests of P3TAA₅/NBR1, frequency 1.0 rad/s, temperature 27 ± 0.5 °C, gap = 0.768 mm at: (a) $E = 0$ kV/mm; (b) $E = 2$ kV/mm.

Figure H3 Storage and loss moduli of pure NBR1 at various electric field strengths vs. frequency, strain 0.1%, temperature 27 ± 0.5 °C, gap = 0.981 mm at: (a) storage modulus, $G'(\omega)$; (b) loss modulus, $G''(\omega)$.

(a)

(b)

Figure H4 Storage and loss moduli of P3TAA_5/NBR1 at various electric field strengths vs. frequency, strain 0.1%, temperature 27 ± 0.5 °C, gap = 0.768 mm at: (a) storage modulus, $G'(\omega)$; (b) loss modulus, $G''(\omega)$.

(a)

(b)

Figure H5 Comparison of the storage modulus (G') of pure NBR and P3TAA/NBR blends at electric field strength of 0 kV/mm and 2 kV/mm vs. frequency, strain 0.1%, temperature 27 ± 0.5 °C, gap range 0.7- 1.0 mm: (a) pure NBR; (b) P3TAA/NBR.

(a)

(b)

Figure H6 Comparison of the storage modulus response ($\Delta G'$) of pure NBR and P3TAA/NBR blends at frequency 1.0 rad/s vs. electric field strength, strain 0.1%, temperature 27 ± 0.5 °C, gap range 0.7- 1.0 mm: (a) pure NBR; (b) P3TAA/NBR.

(a)

(b)

Figure H7 Comparison of the storage modulus sensitivity ($\Delta G'/G'_0$) of pure NBR and P3TAA/NBR at frequency 1.0 rad/s vs. electric field strength, strain 0.1%, temperature 27 ± 0.5 °C, gap range 0.7- 1.0 mm: (a) pure NBR; (b) P3TAA/NBR.

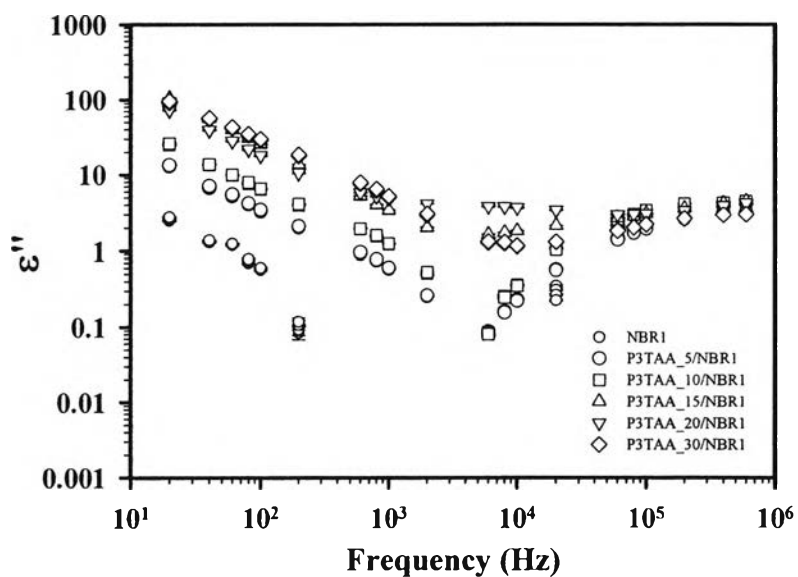

Figure H8 Comparison of the storage modulus response ($\Delta G'$) of pure NBR and P3TAA/NBR1 blends at various electric field strengths (0.1, 0.2, and 1 kV/mm) vs. particle concentrations ($\phi = 0, 5, 10, 15, 20,$ and 30 %vol.) frequency 1.0 rad/s, strain 0.1% , and temperature 27 ± 0.5 °C.

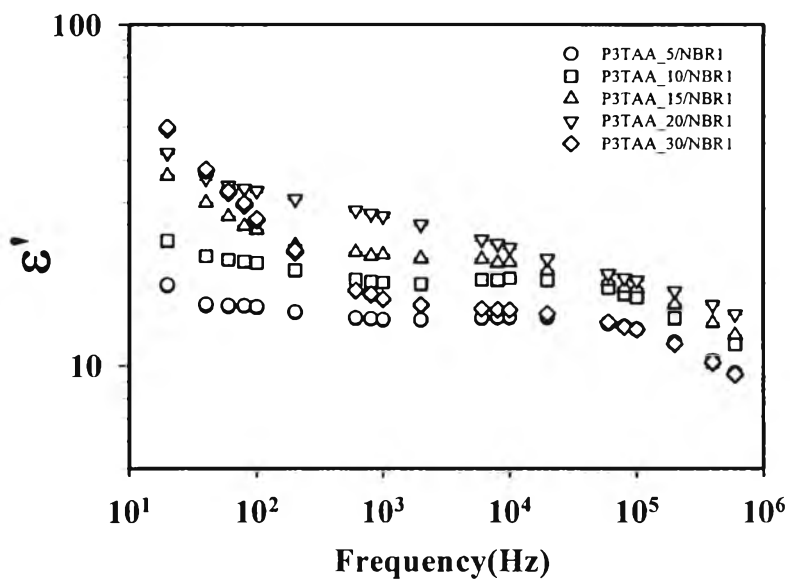

(a)

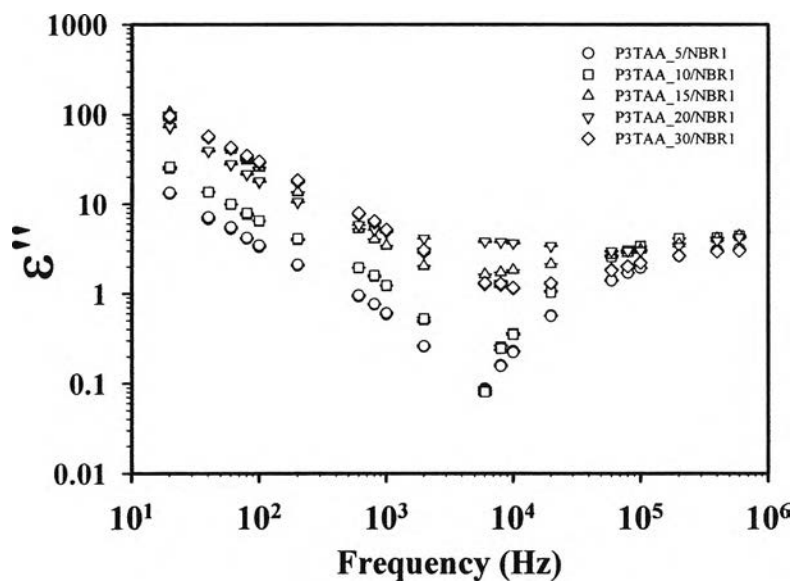

(b)

Figure H9 Comparison of the dielectric constant (ϵ') and dielectric loss (ϵ'') of pure NBR vs. frequency at applied volt = 1.0 volt, temperature 27 ± 0.5 °C, gab range 0.7– 1.0 mm: (a) the dielectric constant, (ϵ'); (b) dielectric loss (ϵ'').

(a)

(b)

Figure H10 Comparison of the dielectric constant (ϵ') and dielectric loss (ϵ'') of P3TAA/NBR blends vs. frequency at applied volt = 1.0 volt, temperature $27 \pm 0.5^\circ\text{C}$, gab range 0.7 – 1.0 mm: (a) the dielectric constant, (ϵ'); (b) dielectric loss (ϵ'').

(a)

(b)

Figure H11 Comparison of the storage modulus response ($\Delta G'$) at various frequency (1.0, 10, and 100 rad/s), strain 0.1%, vs. dielectric constant (ϵ') of pure NBR at applied volt = 1.0 volt, 20 Hz, temperature 27 ± 0.5 °C, gab range 0.7 – 1.0 mm: (a) 1.0 rad/s; (b) 10.0 rad/s; (c) 100.0 rad/s.

(a)

(b)

(c)

Figure H12 Comparison of the storage modulus response ($\Delta G'$) at various frequency (1.0, 10, and 100 rad/s), strain 0.1%, vs. dielectric constant (ϵ') of P3TAA/NBR1 blends at applied volt = 1.0 volt, 20 Hz, temperature 27 ± 0.5 °C, gab range 0.7 – 1.0 mm: (a) 1.0 rad/s; (b) 10.0 rad/s; (c) 100.0 rad/s.

(a)

(b)

Figure H13 Temporal response of the storage modulus (G') at electric field strengths 1.2 kV/mm vs. time (s), frequency 1.0 rad/s, strain 0.1% and at 27°C of: (a) Pure NBR1; (b) P3TAA₂₀/NBR1 blends.

Figure H14 Schematic diagram of the bending response measurement of pure NBR1 and P3TAA_10/NBR1 films suspended vertically in a silicone oil bath and sandwiched between copper plates (30 mm long, 30 mm wide, and 1.0 mm in thickness, the distance between the electrodes is 10 mm) in acrylic box. A DC electric field was applied horizontally at ambient temperature, which causes a deflection distance (a) of the film from its original position to a new position (dash line).

The electric response of the specimens was recorded by a video camera, and the deflection was analyzed by a digital image software (Sciion Image).

Bending angle can be calculated from: (H.1)

$$\tan^{-1}\left(\frac{a}{l}\right)$$

The electric force (F_E) which was calculated from the equation following:

$$F_E = mg \sin \theta + P_E(\theta) \quad (H.2)$$

where m is the sample's weight (kg), g is the gravity (9.8 m/s^2), θ is the bending angle, and P_E is the load force (N) from the field which was calculated from [24]:

$$P_E = \frac{3Ela}{l_o^3} \quad (H.3)$$

where E is Yong's modulus equal to $2G'(1+\nu)$, G' is the shear modulus, ν is poisson's ratio equal to $1/2$ incompressible, I is the moment of inertia equal to $2/3C^3W$ which C is the sample thickness, W is the sample width, a is the deflection distance (a), and l is the sample length.

Table H1 Bending response test of NBR1

Sample	E (V/mm)	θ (degree)	$mg\sin\theta$ (N)	P (N)	F_E (N)
NBR1	0	0.00	0.0000E+00	0.0000E+00	0.0000E+00
	100	4.02	1.0404E-04	3.6616E-04	4.7020E-04
	200	10.71	2.7588E-04	9.2872E-04	1.2046E-03
	300	16.82	4.2973E-04	1.3615E-03	1.7912E-03
	400	17.49	4.4621E-04	1.4014E-03	1.8476E-03

Figure H15 Bending angle and electric force of pure NBR1 vs. electric field strength at room temperature. Size of pure NBR sample is 0.6 mm thick, with the weight 0.1515 g, samples 5.55 mm wide.

Table H2 Bending response test of P3TAA_10/NBR1

Sample	E (V/mm)	θ (degree)	$mgsin\theta$ (N)	P (N)	F_E (N)
P3TAA_10/NBR1	0	0.00	0.0000E+00	0.0000E+00	0.0000E+00
	100	7.92	1.8766E-04	4.9322E-04	6.8088E-04
	200	10.36	2.4504E-04	6.3448E-04	8.7952E-04
	300	12.15	2.8668E-04	7.1589E-04	1.0026E-03
	400	14.06	3.3103E-04	7.7574E-04	1.1068E-03
	500	15.97	3.7489E-04	8.6194E-04	1.2368E-03
	600	24.61	5.6729E-04	1.1229E-03	1.6902E-03
	700	25.53	5.8707E-04	1.2043E-03	1.7914E-03

Figure H16 Bending angle and electric force of P3TAA_10/NBR1 vs. electric field strength at room temperature. Size of P3TAA_10/NBR1 is 0.5 mm thick, weight of 0.1356 g, samples 5.55 mm wide.

CURRICULUM VITAE

Name: Ms. Pacharavalee Thipdech

Date of birth: November 10, 1981

Nationality: Thai

University Education:

2000 -2004 Bachelor Degree of Industrial Chemistry, Faculty of Science,
King Mongkut Institute of Technology Ladkrabang, Bangkok, Thailand.

Working Experience:

2004 Position: Production Engineer

 Company name: Mitsui Hygiene Materials (Thailand)
